BOOK 1 · LEARNER TEXTBOOK

Nine skills for learning, work and community

Build the nine Skills for Success through clear explanations, worked examples, 162 skill activities and two integrated projects.

Reading	Writing	Numeracy
Digital	Problem solving	Communication
Collaboration	Adaptability	Creativity and innovation

Learning, work and community in British Columbia

Original ACCESS IS4S curriculum draft informed by the complete 148-page SkillPlan guide, current federal Skills for Success resources and attributed BC Indigenous education sources.

23 October 2026 · Edition 1 · For instructor review and learner pilot

About this edition

Begin with a useful goal and the skills you already bring. This learner textbook expands all 54 skill components into original instruction and practice. Use it with the practitioner companion for feedback, answer guidance and teaching support.

The original supplied guide remains in the repository. The practitioner book includes the source crosswalk, reference index and online research record. The books use original practice cases and contemporary BC learning contexts. Nation-specific knowledge and protocols require the direction of the relevant people; this draft does not claim community endorsement or official certification.

Keep your responses in a notebook, accessible digital document or the supplied learning templates. Each numbered activity has companion answer guidance. Reading pages, editable source and both PDF books are available from the repository.

In this book

LEARNER 00
Start with the skills you already use

LEARNER 01
Reading: find what you need and use it well

LEARNER 02
Writing: make a message another person can use

LEARNER 03
Numeracy • Find the quantities, choose a method, explain the result

LEARNER 04
Digital • Keep information useful, findable and in your control

LEARNER 05
Problem solving • Understand the issue, choose a response, check what happened

LEARNER 06
Communication • Make room for the message and check understanding

LEARNER 07
Collaboration — contribute, listen and finish together

LEARNER 08
Adaptability — keep the purpose, adjust the plan

LEARNER 09
Creativity and innovation — notice, make, test and improve

LEARNER 10
Put the nine skills to work together

LEARNER 11
Reference and portfolio • Keep evidence you can use

Start with the skills you already use

You bring knowledge and experience to this learning. You may have organized a journey, explained an idea, compared prices, cared for someone, repaired something, asked a useful question or found a way through a changed plan. Some skills may feel familiar. Others may need a clear example, more time or a chance to practise in a new setting. This book gives you those opportunities.

ACCESS IS4S uses the nine Skills for Success to support learning, work and everyday life. The chapters show practical ways to find information, use numbers, communicate, work with other people and make decisions. You do not need to know every term before you begin. Start with a task that matters to you and build from there.

You are welcome to use the fictional situations throughout this book. You do not have to share a personal record, family story, cultural knowledge or experience you would prefer to keep private. You can bring your own example when it helps, after checking what is appropriate to share. The choice of example should help you learn.

Your purpose belongs in the plan

Think of one thing you would like to do more easily. It might be understanding a training notice, checking a calculation, writing a clear message or taking part in a team decision. You may be working toward a job, a course, a community role or a personal goal. You may still be deciding. A small, useful goal is enough to begin.

Try finishing this sentence: “I would like to be able to **__ so that I can** ____.” For example: “I would like to check a changed schedule so that I know when and where to arrive.” This tells you and your instructor what to practise. You can change the goal as you discover what you need.

You may already have a strategy that works. Perhaps you underline a date, talk through a calculation, make a checklist, keep related files together or ask someone to repeat the important detail. Bring that strategy into the activity if you want to. Compare it with the method shown in the book. Keep what helps and try another approach when it does not.

Learning does not have to look the same for everyone. You can ask for time to think, a demonstration, a glossary, larger print, a quieter place, accessible electronic text or help using a tool. Your instructor can explain which supports are available. You do not need to discuss private information with the group to ask what would make a task easier to access.

Find your way through the nine skills

Each skill chapter gives an explanation, examples and activities. The questions below can help you choose where to start. They are a navigation guide, not a test or a ranking.

When you want to...	Start with...	A useful thing to practise
Understand a notice, instruction, table or message	Reading	Find the information, check the conditions and explain what it means.
Give someone clear written information	Writing	Plan for your reader, create a text and revise it.
Use quantities, time, money or measurements	Numeracy	Choose the numbers and units, calculate and check the result.
Complete a task with a device or application	Digital	Use a tool, check the information and save or find your work.
Work through an issue or decision	Problem solving	Identify the issue, compare information and explain a workable response.
Understand others and make your meaning clear	Communication	Listen or receive a message, ask a useful question and check understanding.
Contribute to a shared task	Collaboration	Agree roles, consider ideas and make a decision together.
Respond when a plan or requirement changes	Adaptability	Identify the change, adjust your approach and learn from the result.
Develop and improve an idea	Creativity and innovation	Generate possibilities, try one and improve it.

You will often use more than one skill at a time. Planning a learning session may involve reading a room notice, calculating supplies, entering a table, asking a question and revising a message. Your instructor may ask you to focus on one part while recognizing the other skills you use. You do not need to separate everything you do into nine boxes.

The integrated projects bring the skills together in two complete practice situations. The reference and portfolio chapter explains useful terms and helps you keep examples of your learning. Return to an earlier chapter whenever you need a model or a reminder.

Use a chapter in a practical way

Begin by reading the purpose of the activity. Ask what the person in the situation needs to understand, decide or produce. Look over the supplied notice, table, message or other information before answering. Check whether the dates, units or conditions matter. In a practice case, use the information supplied rather than guessing what a real organization might do.

Study a worked example before trying a similar task. Look for the decisions behind the answer: Why was that number chosen? Why was that sentence clearer? How did the reader know which message was current? You can cover the next step and predict it, then compare your thinking with the example. A different method can be useful when it meets the task accurately.

Try the activity and keep enough of your thinking to explain it. Show the numbers and units for a calculation. Point to a sentence that supports a reading answer. Keep a first draft when you revise a message. For a conversation, note the clarification you asked and what it changed. The evidence can be brief; it needs to show

the action that matters.

Review the attempt with the answer guidance, a partner or your instructor as agreed. Correcting an answer is part of learning. Try to explain the reason for a change rather than simply copying the final result. Then choose a next attempt. You might practise with less prompting, a different document or a new situation that uses the same strategy.

The cases are original classroom simulations unless a source is clearly identified. Their names, schedules, budgets and arrangements are practice information. They are not live bookings, official announcements or instructions from a real employer. When you use a skill outside the class, obtain the current information for that situation and check that it applies.

Work with others and keep your own contribution visible

Partners can help you notice something you missed. They can ask a question, explain an approach or read a draft as its intended audience. Collaboration does not require everyone to have the same idea. A useful disagreement can lead to a clearer answer when people explain their reasons and check the information together.

Agree who will do what before you begin. For a partner explanation, one person can explain while the other listens, restates the message and asks a clarification. Then swap. For a shared table, both people should have a chance to use the tool when Digital is a focus skill. Watching a partner complete everything is different from demonstrating your own action.

You can contribute through speaking, signing, an accessible communication tool, writing or another agreed method suited to the task. Your instructor will explain how the intended skill can be observed. An accurate check-back matters more than looking or sounding a particular way. Ask for a preparation moment if you need one.

If a group product is submitted, identify your contribution. “I checked the room capacity and corrected our total” tells more than “we worked well.” Also name one idea from someone else that helped. You can value shared work and still keep a clear record of what each person learned.

Understand feedback and supports

The activities provide evidence from a particular task under particular conditions. Your instructor may use four feedback descriptions. These are local learning notes, not official Skills for Success levels.

Feedback description	What it means for your next step
Not observed	There was not enough opportunity or evidence to judge this action. Arrange a chance to show it.
Not yet demonstrated	The attempt did not yet show the agreed outcome. Ask which step to practise and what help could be useful.
Demonstrated with support	You met the outcome with a recorded prompt, model or help. Identify what helped and what you want to try next.

Feedback description	What it means for your next step
Demonstrated independently	You met the outcome under the agreed conditions without task-specific prompting. Keep a record of the task and tools you used.

Agree the task conditions before an attempt. You may be allowed a calculator, a glossary or an accessibility tool. Using an agreed tool does not automatically mean you need task-specific help. For example, independently choosing and checking a calculation with a calculator is different from another person choosing and entering the numbers for you.

Supports should fit the skill. You might explain a reading answer aloud and point to the evidence. A Writing activity needs a text you author, even if you use speech-to-text or another agreed tool. A Digital activity needs an opportunity for you to control the device or application. If access is unavailable, record that and arrange another opportunity; a paper substitute does not show the same digital action.

Ask for specific feedback: “Which part was clear?” “Where did I lose the units?” “What would make this message easier for the reader?” “What should I check next time?” These questions can turn a general comment into a useful practice step. One difficult attempt does not describe everything you know or can learn.

Make a small learning plan

Use the following template with your instructor or on your own. You do not need to fill every space at once. Keep the plan somewhere you can find it and return to it after practice.

My learning plan	My note
A task I want to do more easily	_____
Why this matters to me	_____
Something I already do that may help	_____
The skill or action I will focus on first	_____
A support, tool or condition I want to discuss	_____
An activity or example I will try	_____
What a useful attempt would show	_____
When I will review it	_____
My next step after the review	_____

A completed example could be: “I want to find the right version of a session notice. I already check dates, but I sometimes miss a correction. I will compare two versions, mark what changed and explain which instruction applies. I want to begin with both versions side by side. After practice, I will try a different notice and check the version label before answering.”

You can keep a portfolio of selected work. A portfolio does not need to contain every page. Choose examples that show something useful: a first and revised message, a checked calculation, a file you created or a short note about a conversation. Ask how the program stores work and who can see it. Use fictional information when personal details are unnecessary.

Bring learning into another situation

A strategy becomes more useful when you can use it elsewhere. After learning to compare versions of a training notice, you might use the same check with a revised meeting message. After checking units in a supplies table, you might use that habit in a personal purchase comparison. Choose a suitable next context and check the real information before acting.

This is called transfer. It needs its own evidence. Completing a familiar activity does not prove that you can use the strategy in every setting. Record where you tried it next, what was different, what support you used and how it worked. If it did not work yet, identify what needs another explanation or more practice.

Respect your own boundaries in choosing a transfer example. You can use another fictional task instead of sharing a private situation. You also have the right to question unclear or unsuitable information. Asking for clarification, checking a limit or seeking appropriate help can be a strong use of a skill.

A note about this book and its sources

The teaching approach is informed by SkillPlan's *Skills for Success Get Started Guide for Practitioners*, revised March 2024, especially pp.10–11, pp.24–25 and pp.37–42. This book contains original explanations and practice; it does not assign official proficiency levels.

Our emphasis on individual agency and varied Indigenous experiences is also informed by verified BC sources: Douglas College Indigenous Student Services and JIBC's *Living Indigenization: Engagement Protocols & Guidelines*, printed pp.14–15 / PDF p.8, retrieved 23 October 2026. These sources describe their own contexts. This book does not speak for every Nation or assume that learners share cultural practices. Local relationships and your choices matter in how learning takes place.

Reading: find what you need and use it well

Reading helps you turn a document into a useful action. You might check the room for a training session, compare two travel choices, understand a project notice or find out what a form is asking. Reading includes words, symbols, pictures, tables and diagrams. It also includes deciding that a document does not provide enough information to act.

You already bring ways of making sense of information. You may recognize a familiar route, notice an unclear instruction, remember a useful heading or ask someone to explain a new term. This chapter builds a repeatable process around those strengths. You can use the fictional situations throughout. You do not need to share personal records, family information or knowledge that you prefer to keep private.

All organizations, timetables, messages and project arrangements in this chapter are invented teaching cases. They are complete enough for the activities, but they are not live travel advice, workplace procedures or announcements. Read them as practice documents. For real decisions, obtain the actual current document and check its applicability.

Six parts of a useful reading process

The Skills for Success Reading components are:

1. **Identify the task that requires you to read.** What are you trying to find out or do?
2. **Identify the information contained in the document(s).** What is here, and how is it organized?
3. **Make connections between different parts of the document(s).** Which details belong together?
4. **Understand and apply the information.** What does it mean for this particular task?
5. **Evaluate the document(s).** Is the information suitable, clear, credible and sufficient?
6. **Reflect on the document(s).** Who is it written for, how does it work, and what should you carry forward?

These are connected actions, not six boxes you must complete in a fixed order. A confusing footnote may send you back to the heading. A missing date may stop you from using an otherwise clear instruction. The aim is an accurate understanding, with a reason you can explain.

Choose supports that let you work with the text: larger print, a ruler under a line, a glossary, text-to-speech, a reading partner or extra time. Keep track of the support used. You can demonstrate comprehension by pointing to evidence, explaining aloud, using an accessible communication method or writing. This chapter does not require polished writing to prove that you understood a reading.

Begin with the task, then preview the document

Before reading every word, finish this sentence: “I need this document so that I can....” A precise purpose narrows the search. “Find the check-in room for a first visit” is more useful than “read the schedule.” A person looking for lunch arrangements may use the same document differently.

Preview the title, date, sender, headings and document type. A table usually lets you compare categories. A paragraph may explain a condition. A diagram shows relationships or location. **Skimming** gives you the general message. **Scanning** helps you locate a specific item. **Close reading** checks the exact wording around that item. Strong reading often uses all three.

Case document A: a first visit to the training room

Fictional Northside Learning Room • Welcome note • Version 2, issued for Practice Day 1

Purpose. This note explains the classroom visit for people attending the introductory learning session. It replaces the earlier draft that named Room 3. All activities described here take place in classrooms. There is no equipment operation or worksite tour during this visit.

Arrival. Please arrive at the reception desk between 08:40 and 08:55. Reception is beside the main entrance. A staff member will check your learning ID and direct you to Room 2. If you do not have a learning ID, reception will provide a temporary classroom label. You do not need to bring identity documents for this fictional practice activity.

What to bring. Bring a pen or use one supplied in the room. Printed workbooks and calculators will be available. A phone is optional. The activities can begin on paper, and a shared device will be available for the later digital task. Tell the instructor if you would like enlarged print, a quiet reading space or another available support. You can ask privately.

Changes. The introductory session ends at 11:30. An optional resource-table visit follows until 11:50. The resource table is not part of the required session. A separate afternoon session appears on the building schedule, but it is for a different group. If two documents seem to disagree, ask reception which version applies to your group before changing your plan.

Time	Introductory group activity	Place
08:40–08:55	Check in	Reception
09:00–10:10	Welcome and learning tasks	Room 2
10:10–10:20	Break	Classroom or nearby seating
10:20–11:30	Practice and review	Room 2
11:30–11:50	Optional resource table	Room 1

RD-01 • State the reading task

You are helping a fictional learner prepare for their first visit. They ask, “Where do I go first, and do I have to stay after 11:30?” State two precise reading goals. Locate the part of document A that answers each goal. Explain why the afternoon session mentioned in the note is not relevant to this person's plan.

RD-02 • Preview before you search

Identify the document's audience, purpose and version. Name two features that help you find information. Then choose how you would begin each task: skim for an overview, scan for a time, or read a paragraph closely for a condition. Use these tasks: understanding the visit generally; finding the break time; deciding whether a phone is required. Explain one choice.

Worked example 1: a word that changes the answer

Question: Must every introductory learner attend the resource table?

First identify the requested information. “Must every learner” asks about a requirement, not whether the table exists. Scan for “resource table.” Read both the table row and the paragraph headed Changes. The row says “Optional,” and the paragraph says it is not part of the required session. Together they support: **No. The required session ends at 11:30; the resource table is optional.**

The competing detail is its appearance on the schedule. A scheduled event is not automatically compulsory. Reading the label prevents that mistake. Words such as **optional, required, before, after, except, only** and **unless** deserve close attention because they limit a general statement.

RD-03 • Build useful vocabulary

Use document A to explain **optional**, **replaces**, **temporary** and **applies** in this context. Give the nearby words that helped you. Choose one term and make a new classroom example using it accurately. If you know a useful equivalent in another language, you may add it for your own use; sharing it is optional. Check uncertain meanings with a glossary, partner or instructor rather than guessing silently.

Find the information, including its limits

A good search follows the question. **Who** usually asks for a person or role. **Where** asks for a place. **When** asks for time or a condition. **Which** asks you to select between options. **Why** often needs a reason across more than one sentence. Underline the requested information and any limits before searching.

Tables need the same care as sentences. Read the title, column headings, row labels and notes. Keep a finger or pointer on the row while moving across it. Do not take a number from a nearby row because it looks familiar. A symbol's meaning comes from its legend, not its shape alone. An asterisk might identify a footnote; it does not always mean a warning.

Case document B: choosing a classroom journey

Fictional practice journey planner • Day 1 only

The learner starts at Cedar Stop and needs to reach the Northside Learning Room reception by 08:55. This is a fictional route exercise. The timetable does not describe a real service. All listed journeys run on the practice day. The learner can choose either route, and no fare calculation is needed.

Route A is direct. It arrives at Northside Stop, which is beside the learning room's main entrance. Allow five minutes between the listed arrival and reaching reception. That allowance is a task assumption, not a measured travel time for a real person. If a learner needs a different allowance, the plan must be reconsidered using that requirement.

Route B involves a connection at Market Stop. A connection is usable in this exercise only if the first vehicle arrives at least five minutes before the next departure. The second vehicle also arrives at Northside Stop. Add the same five-minute reception allowance. The table shows the individual services; it does not promise that every combination makes a connection.

Service	Leaves Cedar	Arrives Market	Leaves Market	Arrives Northside
A1, direct	08:05	—	—	08:35
A2, direct	08:25	—	—	08:55
B1, first leg	08:10	08:25	—	—
B2, second leg	—	—	08:28	08:43
B3, second leg	—	—	08:32	08:47

Legend: A dash means the field does not apply to that service. It does not mean a cancelled trip. A service number identifies one row, not a whole journey with a connection.

RD-04 • Scan accurately

Find the departure and arrival for direct service A1. Identify which service leaves Market at 08:32. Explain what the dashes in that row mean. Point to the heading and legend that support your answers. You may say the answer aloud while marking the row instead of copying the whole timetable.

RD-05 • Read the condition

A classmate says, “B1 arrives before B2 leaves, so the connection works.” Find the exact condition that must be checked. Does the statement meet it? Explain using the times and the minimum connection allowance. Then identify a different second-leg service that can be combined with B1.

Worked example 2: combine a table and a paragraph

Question: Does direct service A2 meet the reception deadline?

The row gives an arrival at Northside of 08:55. The paragraph requires a further five-minute allowance to reception. Therefore the task's reception time would be 09:00. That is later than the 08:55 deadline. **A2 does not meet the requirement in this exercise.**

The reading challenge is to connect “arrives Northside” with “reaches reception.” They name different points. The arithmetic is small, but finding the relevant rule is essential. If the table's heading had already been “Arrives reception,” adding the allowance again would be wrong. Check what a number represents before

calculating.

RD-06 • Choose with evidence

Choose two journeys from document B that meet the reception deadline. For each, identify the service or services, Northside arrival, reception allowance and planned reception time. Explain a difference between the two choices without claiming that one is best for every learner. Now change the reception allowance to ten minutes: which of your choices still meets the deadline?

Connect details without inventing missing facts

Some information is stated directly. Other information can be inferred by combining details. An **inference** is a reasoned conclusion, not a free guess. “The project needs both a place and a time” can follow from an invitation that asks people to attend. “The project is behind schedule” does not follow merely because an invitation was revised.

Use four labels while reading: **stated**, **supported inference**, **contradicted**, and **not established**. A contradicted statement conflicts with the document. An unestablished claim needs information the document does not provide. Keeping those separate helps you notice the exact question that still needs an answer. You do not have to force every document into a complete story.

Case document C: who is responsible for what?

Fictional Willow Reach access project • Public learning brief, version 1

The fictional Town of Willow Reach owns an access route serving a recreation centre and a delivery area. The Town's project team describes what the project must achieve, manages the agreement with the contractor and checks the delivered work against that agreement. The fictional Pathway Paving Company is the contractor. It carries out the work it has been engaged to deliver. The roles of owner and contractor are different even when both are working toward the same project outcome.

The practice funding plan contains $60,000 from the Town, $40,000 from the fictional Regional Access Fund and $20,000 from the fictional Community Route Fund. These names and amounts are invented. Contributing money does not, by itself, make a funder the road owner. The funding amounts also do not tell us a contractor's profit, a worker's pay or the cost of each activity.

This learning brief is about roles and questions. It does not supply a work schedule, a traffic plan, operating instructions, environmental findings or legal permissions. The project team would need current applicable documents for a real project. For this classroom exercise, questions about ownership go to the Town's project contact; questions about the contractor's proposed classroom display go to Pathway's training contact. Neither contact has been given authority here to answer for the other organization.

Notice for learners. A classroom information display will explain where paving material comes from and how the project roles differ. Visitors are asked to identify questions they would want answered before a real project begins. No visitor should treat this practice display as a notice of actual construction.

```
Town of Willow Reach: owner and project team
            | engages a contractor for described work
```

```
            ▼
Pathway Paving: contractor

Town contribution + two fictional funds: funding plan
Funding contribution alone does not establish ownership.
```

RD-07 • Follow the role, not the familiar name

Who owns the route? Who carries out the contracted work? Which contact would receive a question about ownership? Which would receive a question about the contractor's classroom display? Cite a sentence for each decision. Explain why the funding paragraph is insufficient to identify a contractor's profit.

RD-08 • Separate evidence from assumption

Label each statement stated, supported inference, contradicted, or not established: “The Town and contractor have different roles”; “More than one organization contributes to the practice funding”; “The contractor owns the road”; “Construction starts next Monday”; “The brief is suitable for deciding the legal permits for a real job.” For a statement that is not established, name the missing document or detail rather than simply saying “wrong.”

RD-09 • Use both forms of the message

Compare the diagram and paragraphs in document C. Identify one fact both forms communicate, one qualification that is clearer in the paragraphs and one question neither form answers. Then choose which form you would use for a quick introduction and which you would consult for a responsibility question. Your choice must refer to the information needed, not only to personal preference.

Evaluate a document before relying on it

A clear-looking document can still be unsuitable. Ask who produced it, when and for what audience. Check whether it names its sources and explains its limits. Consider the difference between a sales claim, an official project instruction, a personal opinion and a classroom example. These can all be useful for different purposes; their authority is not interchangeable.

Check the actual claim, too. “Always” requires much stronger evidence than “in this example.” A photograph may show an item without proving how it performs. A newer date helps identify a version, but newer does not automatically mean accurate or applicable. A document needs both a traceable source and relevant content.

Case document D: two environmental messages

D1 • Fictional promotional card. “Our nearer supply source proves asphalt is always greener than concrete. Save time: there is no need to compare alternatives.” The card supplies no author, study, date, quantities, transport assumptions or definition of “greener.”

D2 • Fictional classroom comparison note. “The example lists one source for an asphalt option at 20 km from the work area and one source for a concrete option at 50 km. The distances are invented. They describe one-way routes, not total travel. Quantities, number of trips, vehicle loads, production impacts, maintenance and design-life information are missing. The note cannot rank the total environmental impact of the two options. A fair comparison would need the same project purpose and comparable service requirements, together with relevant evidence for the impacts being considered.”

RD-10 • Judge what a claim can support

Identify D1's main claim and two features that make it unreliable for a whole-project environmental conclusion. State the limited comparison D2 permits. Name two missing facts that would matter before making a broader comparison. Explain how D2's admission of limits affects its usefulness for this reading task.

Worked example 3: resolve a version conflict

An old classroom notice says, “Introductory group: Room 3.” Document A says “Version 2,” identifies the introductory audience and explicitly replaces the earlier Room 3 draft. It directs learners to Room 2 after reception. For this fictional visit, **use the Room 2 instruction** and check in first. This conclusion depends on the replacement statement and matching group, not only on a bigger version number.

If the second document were for a different group, its newness would not settle the conflict. If neither document identified which one applied, the next action would be clarification. Reading well includes knowing when a comparison cannot be resolved from the available evidence.

RD-11 • Inspect a source record

Compare these supplied records: **Record X:** “Equipment guide,” screenshot, no issuer or edition. **Record Y:** “Classroom equipment-purpose cards,” prepared for this workbook, labelled introductory, no operating instructions. Which could support identifying the intended purpose of this workbook's card activity? Could either justify operating equipment? List three additional details you would seek before relying on an actual technical document. Do not invent those details.

RD-12 • Apply a precise update

Read this fictional update: “Practice Day 1, introductory group only: check-in remains at reception. The 10:20–11:30 practice block moves to Room 4. The 09:00 welcome remains in Room 2. Issued as an update to Welcome Note version 2.” Identify exactly which table entry changes and which entries stay the same. Explain why rewriting the entire day as “Room 4” would be inaccurate.

Reflect on how the document works

Reflection includes looking back at the document, not only judging yourself. Who needs the information? What does the writer emphasize? What evidence is offered, and what is left out? Does the structure help the intended audience? A short notice can be effective because it removes unnecessary detail, yet become

misleading if it removes an essential condition.

Your reading process also matters. Notice where you first looked, what slowed you down and what helped you recover. “I am bad at tables” is a broad judgement with no next action. “I skipped the heading, so I compared workers with employers” identifies a habit you can change. Keep the observation connected to an actual example.

Case document E: borrowing a classroom resource

Fictional resource desk guide • Current classroom copy

The resource desk lends practice books and calculators during the learning block. A learner may borrow one calculator and up to two books at a time. Each item has an item code. The code identifies the item, not the borrower. The classroom borrowing sheet uses learning IDs so that personal details do not need to appear in the activity.

To borrow an available item, tell the desk helper its code and your learning ID. The helper records the item and the agreed return point. “Available” means the desk can lend it now. “Reserved” means the item is set aside for another booking. “In use” means it has already been lent. These labels can change, so the desk helper checks the current sheet before agreeing to a loan.

The guide is written for learners who want a resource during the classroom block. It does not describe a public library account or a charge. If an item is unavailable, choose another suitable resource or ask when it may become available. The guide does not promise a return time for an item marked “In use.”

Item code	Item	Status at the time of this exercise
C04	Basic calculator	Available
C05	Large-display calculator	Reserved
B12	Measurement practice book	In use
B16	Document-reading practice book	Available

RD-13 • Read for audience and purpose

Who is document E written for? What practical decision does it help them make? Identify one feature that helps a first-time borrower and one detail deliberately outside its scope. Explain why the sentence about learning IDs belongs in this document even though it does not describe the equipment.

RD-14 • Apply the conditions

A learner wants C04 and B16 immediately. Another wants C05 and needs a specific display feature. Use the guide and status table to explain the next step for each. Do not tell the second learner that an unsuitable alternative must meet their needs. What can the document establish, and what should the desk helper clarify?

RD-15 • Notice what a summary loses

A proposed sign reads, “Borrow any calculator and two books. Give your details to the helper.” Compare it with document E. Identify three ways the sign could mislead a reader or remove a useful protection. Explain the information that a corrected sign should retain. You may annotate the sign and explain aloud; writing a polished replacement is optional.

Transfer the process to a different setting

The same reading habits work across trades, service work, study and everyday planning. The document changes; the need to identify purpose, conditions, evidence and gaps remains. Transfer does not mean assuming that a rule from one setting applies somewhere else. It means bringing the process of checking.

RD-16 • Independent transfer: booking a practice room

Use this complete fictional booking note: “Room East holds up to eight people and is available 13:00–14:00. Room West holds up to twelve and is available 13:30–15:00. Bookings need a ten-minute setup period before the meeting, within the room's available time. A group of ten wants a 45-minute meeting starting at 14:00. Ask the desk to confirm any booking; this note is not a reservation.” Select a suitable room, explain how the size and time conditions connect, and identify the remaining action. Then explain what changes if the meeting must start at 13:30.

RD-17 • Show your reading route

Choose document A, B, C or E. Ask a partner to choose a new detail question using only that document. Before answering, state the information you need, show where you look and explain any condition you checked. Then swap roles. If the answer is missing, identify that clearly. Keep the partner's question and the evidence you used so the instructor can observe your reading, not merely your memory.

RD-18 • Compare and reflect

Compare the promotional card D1 with the resource guide E. Explain their audiences, purposes and use of evidence. Point to language that attempts to influence the reader. Select one reading strategy that helped you in an earlier activity and one situation where it was insufficient on its own. Choose a next practice task from this chapter, naming the detail you will check more deliberately. You can provide your reflection orally with marked documents.

Keep evidence of what you can do

Reading component	Main practice evidence
Identify the task that requires you to read	RD-01, RD-02, RD-17: clear purpose and requested information.
Identify information in documents	RD-03–RD-05: vocabulary, headings, rows and conditions.

Reading component	Main practice evidence
Connect parts of documents	RD-06–RD-09, RD-12: paragraphs, tables, diagrams and updates used together.
Understand and apply information	RD-07, RD-14, RD-16: a justified decision for the specified case.
Evaluate documents	RD-10–RD-12, RD-15: source, scope, version and adequacy checked.
Reflect on documents	RD-13, RD-18: audience, purpose, language and evidence considered.

Use the local feedback descriptions **Not observed**, **Not yet demonstrated**, **Demonstrated with support** and **Demonstrated independently**. Record transfer separately when you use the process in a new situation. These descriptions are not official proficiency levels. Keep a marked document, a short explanation and the support used. Together they give a more useful picture than speed alone.

Source and teaching notes

The six component names are recorded in SkillPlan's supplied *Skills for Success Get Started Guide for Practitioners*, revised March 2024, PDF/printed page 45. Document-use integration is discussed on page 46; contextual documents and foundational reading on pages 47–49; explicit skimming, scanning and question strategies on pages 49–50; assessment cautions on page 51; and document comparison/reflection activities on page 53. All case documents, questions and worked examples here are original teaching designs. The source guide's descriptions do not establish official proficiency scores for these new activities.

Writing: make a message another person can use

Writing helps a reader understand, decide, remember or act. A useful piece of writing might be a two-line request, a completed form, a clear label, a table or a longer explanation. Its success depends on the task. A short note can be effective when it includes exactly what the reader needs. A longer document can fail when its important point is difficult to find.

You can build writing through practice, feedback and revision. You may already organize information for work, study, appointments or activities you choose to support. This chapter gives those actions a visible process. You can use the supplied fictional cases rather than personal experiences. No activity requires a real message to be sent, a real account to be opened or private information to be shared.

All people, organizations, schedules, quantities and funding arrangements below are invented for learning. The documents resemble useful workplace and classroom formats, but they are original simulations. They do not establish a legal reporting requirement or a workplace procedure. The focus is writing that is accurate for the information you have.

Six parts of writing with a purpose

The Skills for Success Writing components are:

1. **Identify the task that requires you to write.** Name the purpose and intended reader.
2. **Plan the writing task.** Gather information, decide what matters and organize it.
3. **Use written words and phrases so you can achieve the purpose of the writing task.** Make the meaning clear enough to use.
4. **Choose the appropriate language and style for the writing task.** Match the reader, relationship and context.
5. **Choose the appropriate format for the writing task.** Use a message, form, list, table or another useful structure.
6. **Review and revise your writing.** Check facts, meaning, tone and presentation, then improve them.

Writing is not always a straight line through these components. You may discover a missing fact while drafting. A reader's question may show that your chosen format hides the answer. Going back to the plan is part of writing, not proof that you failed.

You may handwrite, type, use speech-to-text or work with a scribe. To show your Writing skill, you need to control the words, review the resulting text and decide on revisions. A discussion that produces no learner-authored text does not show this chapter's writing outcome. Record supports so the evidence describes what you actually did.

Start with the reader and the needed action

Before drafting, answer four questions: Who will read this? What do they need to know? What should they do next? What information do I have the authority and evidence to state? These questions prevent two common problems: writing everything you know, and leaving out the one detail that makes action possible.

A useful request often begins with the request, followed by the context needed to answer it. A factual record often begins with what happened and when. A public notice often begins with the event and essential arrangements. “Formal” does not have to mean complicated. Respectful, direct wording usually helps readers across roles.

Case document A: a resource request with a deadline

Fictional classroom planning record • Introductory learning session

The Northside Learning Room is preparing a classroom session for twelve learners. The session begins at 09:00 on Practice Thursday. The learning tasks include reading a short project brief, checking a small number table and recording a result. Paper workbooks are already available for every learner. Learners may work in pairs for the calculator activity, so the plan calls for six calculators at the start of the session.

The resource cupboard currently contains four working practice calculators. The desk helper can check whether two more can be lent from another classroom. The helper needs the item, quantity, required time and return plan. They cannot promise a loan until the other classroom's booking has been checked. The intended recipient of your message is the resource desk helper, not the learners attending the session.

The session ends at 11:30. The instructor has offered to return the borrowed calculators to the resource desk by 11:45. The helper asks to receive the request by 15:00 on Practice Wednesday so they can check availability. If the extra calculators cannot be supplied, the instructor will adapt the activity. Your role is to request the items and ask for confirmation, not to claim they are already booked.

The planning record also mentions that one staff member prefers tea and that the room's old storage labels were blue. Neither fact affects the calculator request. The names and needs of individual learners are not required. Use the group size only if it helps explain the quantity. This is a practice message; do not send it to a real service.

WR-01 • Define the writing task

Write a planning note that names the reader, purpose, requested action and information you must avoid presenting as confirmed. Give the note a useful title. Include one sentence explaining why the learners' personal details are unnecessary for this task.

WR-02 • Select the information

Make a two-column planning table: **Include** and **Leave out**. Sort at least eight details from case A. For two choices, explain how the detail helps or distracts from the reader's decision. Check that your Include column contains the exact extra quantity, required time, return plan and request deadline.

WR-03 • Organize before drafting

Plan a four-part request: subject line, request, supporting context and confirmation question. Write short notes under each part. Arrange the information so the helper can answer without searching the whole paragraph. If a fact is missing, mark the question you would ask rather than inventing an answer.

Worked example 1: turn the plan into a useful request

Subject: Request for two calculators for Practice Thursday

“Hello resource desk team. Could we borrow two calculators for the Northside Learning Room session starting at 09:00 on Practice Thursday? We have four calculators and need six for paired activities. The instructor can return the borrowed items by 11:45. Please confirm whether two are available. This request is being prepared before the 15:00 Practice Wednesday deadline. Thank you.”

The message states the extra quantity rather than the total quantity. It includes when the items are needed and when they will return. “Could we borrow” and “please confirm” show that this is a request, not an established booking. The subject lets the recipient understand the topic before opening the message.

The model is one valid version, not wording to memorize. A shorter message could work if it retained the decision-making details. A more familiar greeting could also be appropriate. The test is whether the intended reader can understand and respond accurately.

WR-04 • Write your request

Using your plan, write a complete practice message of about 70–110 words. Include a subject and an explicit question the helper can answer. Check the quantity against case A. Then underline the words that show availability is not yet confirmed. Keep your own wording rather than copying the worked example sentence by sentence.

Choose words that carry a clear meaning

Readers should not have to guess who “they” are, what “it” refers to or whether “later” means today or next week. Specific nouns and times can solve these problems. “Return the two borrowed calculators by 11:45” is clearer than “Bring them back later.” Repeating a key noun can be useful when several items or people are involved.

Sentence boundaries also carry meaning. Use one sentence for an action and another for its condition when that makes the instruction easier to follow. Put closely related information together. A comma or full stop is not merely a marking rule; it helps the reader separate ideas. Check names, quantities and units with particular care because an otherwise smooth sentence can still communicate the wrong action.

WR-05 • Repair ambiguity

Revise this practice message using case A: “They need them Thursday. Bring it before the class and give them back after. We need six more, I think. It should be fine.” Make the recipient, item, extra quantity, timing and unconfirmed status clear. Then explain two changes you made and the misunderstanding each prevents.

WR-06 • Change the reader

Now write a short classroom notice for the twelve learners. They need to know that the activity can begin with supplied paper workbooks and that they do not need to bring a personal calculator. The borrowing request is still pending. Write 40–70 words that explain what learners should bring or do without promising that six calculators have been secured. Identify one detail from your request that this audience does not need.

Plan a factual record before interpreting it

A record is useful when another person can understand what was observed, what was reported by someone else and what remains unknown. Separate those categories. “The box contained 22 workbooks when counted” is an observation in the case below. “The supplier deliberately removed two” is an accusation that the case does not support.

Use who, what, when and where as prompts, then add the action taken and the unresolved question. Not every form needs all possible details. A classroom materials record should not include personal learner information simply because there is room on the page. A blank field may mean information is missing; use “not provided in the case” where appropriate rather than making up a name or code.

Case document B: the workbook delivery

Fictional materials-desk case • Practice Tuesday

At 09:10, a classroom helper receives a sealed box at the Northside resource desk. The delivery note lists 24 copies of the introductory workbook. The outside label reads “Introductory workbooks, box 1 of 1.” The case gives no order number or supplier contact name. The helper opens the box on the desk and counts 22 workbooks. A second classroom helper independently counts the same 22 copies at 09:15.

The helpers keep the delivery note and put the 22 workbooks together on the resource shelf. At 09:20, they tell the instructor that the note and count differ. The instructor asks for a short written record so the resource coordinator can check the order. The coordinator has not yet contacted the supplier. No explanation for the difference has been confirmed.

The class needs the workbooks for a later session, and existing spare copies may be available. The instructor will decide how to prepare that session after checking the cupboard. The helpers should not promise replacement delivery, describe a refund, change the supplier's paperwork or claim that anyone caused the discrepancy. Their immediate writing task is to preserve a clear account and request the appropriate check.

One draft note on the desk says, “The supplier messed up again and left us short. Someone should fix this right away.” That draft contains an unsupported claim about a repeated problem, gives no quantities and does not identify who should take the next step. You have enough information to produce a more useful record.

WR-07 • Complete the form

Create and complete this practice form using case B: **Practice day; location; item; receipt time; quantity on delivery note; quantity counted; count-check time; action already taken; information still missing; requested follow-up**. Use short entries where they are sufficient. Do not invent an order number or contact name. Keep the difference between the receipt time and recount time visible.

WR-08 • Replace judgement with evidence

Rewrite the draft note from case B as three or four factual sentences. Include the quantities, the independent recount, the action already taken and the next check. Mark one phrase you removed because it was unsupported. Explain how the revision lets the resource coordinator investigate without accepting an accusation as fact.

Worked example 2: order the record for the reader

An unordered note reads: “Instructor told. Twenty-two books. It said twenty-four. Counted again at 09:15. Box arrived 09:10.” A useful revision is:

“At 09:10 on Practice Tuesday, a box of introductory workbooks arrived at the Northside resource desk. The delivery note listed 24 copies. Two helpers counted 22 copies, with the independent recount completed at 09:15. The instructor was informed at 09:20. The resource coordinator is asked to check the order and the discrepancy. The cause has not been confirmed.”

The revision organizes events in time order, names the item and distinguishes the listed quantity from the observed count. It does not hide the uncertainty. It also does not add a conclusion about who is responsible. The reader can now see both the evidence and the action requested.

WR-09 • Write a short record for a handover

Write a 100–140-word handover record for the resource coordinator using case B. Include a heading, a factual account and a separate **Follow-up needed** line. State what happened to the delivered workbooks and delivery note. Review your wording for a claim that goes beyond the evidence. A partner should be able to identify the discrepancy and the next step from your text alone.

Choose a format that supports the task

Different formats do different work. A numbered list is useful when order matters. Bullets suit a set of items without a required sequence. A table helps readers compare the same categories across several items. A paragraph explains a relationship or reason. A form helps collect a consistent set of fields.

You can combine formats, but every extra element should serve the reader. A large title cannot repair an inaccurate table. A colour highlight should not be the only way a reader knows which item matters. Clear labels and words should preserve the meaning in black-and-white print or an accessible text version.

WR-10 • Write an ordinary classroom procedure

Use these complete fictional borrowing rules: a learner chooses an available practice item; tells the desk helper the item code and learning ID; the helper checks the current sheet and agrees a return point; the learner checks the recorded item and return point; the item is returned to the helper at that point. If the item is unavailable, the learner asks about a suitable alternative. Write five numbered steps and a separate sentence for the unavailable-item condition. This is a classroom-resource procedure, not equipment-operation guidance.

WR-11 • Turn notes into a readable table

Convert these supplied notes into a table with a clear title and headings: “C04 basic calculator available; C05 large-display calculator reserved; B12 measurement practice book in use; B16 document-reading practice book available. Statuses are for this classroom exercise only. The helper checks the current sheet before agreeing to a loan.” Include the status limitation and checking instruction below the table. Explain why item codes and status labels need separate columns.

Match style to the reader without losing respect

Style includes tone, vocabulary, sentence length and how directly you state the action. A familiar team message can be brief without becoming vague. A message to someone you have not met can be courteous without using elaborate phrases. Avoid labelling readers as careless or assuming why they have not responded. Describe the information needed and make the next step clear.

Plain language does not mean removing every technical term. Some terms are necessary. Explain them when the audience may not know them, and use the same term consistently. A notice for visitors may say “the organization that owns the route” before using “owner.” An internal record may use the established role title without repeating the explanation.

Case document C: a classroom information display

Fictional Willow Reach project-learning display • Planning brief

The learning group is preparing a classroom display called “From materials to a finished road.” It introduces the pit-or-quarry, plant, haul, place and compact stages and explains that equipment items have different purposes. The display contains no operating instructions and is not a public construction notice. It uses the fictional Willow Reach access project to help visitors ask useful questions about responsibilities and information sources.

In the example, the Town of Willow Reach owns the route and manages the project agreement. Pathway Paving is the contractor engaged to deliver described work. Practice funding is $60,000 from the Town, $40,000 from the fictional Regional Access Fund and $20,000 from the fictional Community Route Fund. The labels and amounts must remain identified as fictional. The brief does not establish any real grant eligibility, permit, schedule or environmental result.

The classroom display visit is on Practice Friday, 13:00–13:40, in Room 2 at the Northside Learning Room. This is an invented session, not an actual invitation. Visitors first check in at reception. They do not need to bring tools or personal devices. Printed explanations are provided. The planning team can prepare enlarged copies if

requested by 15:00 on Practice Thursday. Questions and requests are directed to the classroom coordinator in this simulation. Do not invent a phone number or email address.

The group needs two documents: a visitor notice that gives the essential arrangements and an internal planning note identifying who will prepare the materials. The visitor does not need individual learner names or private support information. The internal note should record agreed tasks, not make assumptions about what someone can do based on their background.

WR-12 • Write a visitor notice

Write a notice of 90–130 words using case C. Include a title, purpose, practice day, time, room, first arrival point, what visitors need to bring and how to request enlarged copies. Keep the fictional status visible. Use a structure that helps a reader find the arrangements quickly. Do not add a contact address that was not supplied.

WR-13 • Make the tone useful

Revise this internal draft: “You never follow the plan. Just put the stuff in the room and make it nice. Everyone knows what to do. Don't bother the coordinator.” Use only case C to replace it with a respectful request that identifies a useful task and asks for confirmation where responsibility is not assigned. Explain which details you cannot honestly supply yet. Then write a different opening suitable for the visitor notice rather than the internal team.

Review meaning before polishing sentences

Revision changes the substance: the facts, organization, missing information or suitability for the reader. Proofreading checks the final surface: spelling, punctuation, formatting and small copying errors. Both matter, but polishing an unsupported claim does not make it true. Start with purpose and facts, then work toward presentation.

Read as if you were receiving the message for the first time. Can you locate the action? Are names, dates, times, quantities and units correct? Does “confirmed” actually have evidence? Is the scope clear? Finally, read the text aloud or listen through a tool to notice awkward phrasing. You remain responsible for checking the output of a spelling or writing tool against the source.

Worked example 3: a small edit can change the promise

Draft: “Join our real roadwork tour Friday at 1. Bring your tools. All special copies are ready.”

Case C does not support a real worksite tour, a tools requirement or the claim that requested copies are ready. A substantive revision is: “Visit our fictional project-learning display on Practice Friday, 13:00–13:40, in Room 2. Check in at reception first. Tools are not needed. Ask the classroom coordinator for enlarged copies by 15:00 on Practice Thursday.”

Only after those corrections does proofreading become useful. Check the hyphenation or punctuation if needed, but do not spend the whole review making the wrong event description look polished. The revised wording makes the action possible and keeps promises within the brief.

WR-14 • Check against the source

Review this new draft: “The Willow Reach display runs 13:00–14:00 in Room 3 on Practice Friday. Go straight to the room. Bring a calculator. Enlarged copies can be requested any time. The $120,000 funding comes entirely from the contractor.” Identify every factual conflict with case C, then write a corrected version. Label one correction about time, one about access/instructions and one about project roles or money.

WR-15 • Use reader feedback while keeping authorship

Give your WR-12 notice to a partner. Ask them to underline the time, first arrival point and copy-request deadline, then identify one phrase that could be clearer. Listen to their interpretation. Complete at least two purposeful review actions: make one justified change that improves clarity, and check one important fact against case C. If that fact is already correct, retain it and record the verification rather than inventing an error. Keep the first version, revised version and a short change note. You can explain why you declined a suggestion if it would remove accurate information.

Write independently in a new context

Case document D: reserving a practice room

Fictional group-planning brief

Ten learners need a room for a 45-minute peer-learning meeting starting at 14:00 on Practice Monday. They need ten minutes in the room beforehand to arrange paper resources. Room East holds eight people and is available 13:00–14:00. Room West holds twelve and is available 13:30–15:00. These are classroom planning values, not a real booking system.

The desk coordinator handles requests. A room is not reserved until the coordinator confirms it. The message should identify the group size, desired meeting time, setup period, selected room and requested confirmation. It should not include learners' names or reasons for individual support requests. The coordinator will clarify access arrangements with the group if needed.

The group can return the room to its ordinary classroom layout by the end of its requested booking. If a room cannot meet all conditions, the writer should identify the conflict and request an alternative rather than change a requirement silently. Keep copies of the request and any reply so later changes can be traced.

WR-16 • Independent request and record

Write a complete room request using case D. State the whole period you need, including setup, and ask for confirmation. Then make a one-row planning record with **request status, room, date label, group size and requested time**. The status must match a request that has not yet received a reply. Check that your message and table agree.

WR-17 • Revise when the requirement changes

After drafting WR-16, read this fictional change: “The group now needs to start at 13:30. All other needs stay the same. No new room availability has been supplied.” Write a follow-up that refers to the previous request, explains the changed need and identifies why the original plan no longer meets all conditions. Ask a precise question instead of claiming an alternative is available. Update the planning record without erasing the history of the first request.

WR-18 • Show what changed in your writing

Choose two pieces you wrote for different audiences or purposes. Add a brief writer's note to each explaining the purpose, chosen format and one important wording decision. Select a before-and-after passage and explain how the revision improved accuracy or usefulness. Finish with a specific next practice goal, such as making confirmation questions clearer or checking times against the source. Use actual text as evidence rather than judging yourself as a “good” or “bad” writer.

A practical check before sharing

Use this final sequence on your own draft: **purpose** → **facts** → **reader** → **format** → **wording** → **proofread**. For a practice message, sharing means giving it to your instructor or partner, not sending it to the fictional organization. For a real message later, check the actual recipient and your authority to share the information.

Writing component	Main evidence in this chapter
Identify the writing task	WR-01, WR-06, WR-12: purpose and audience guide the text.
Plan the writing task	WR-02, WR-03, WR-07: selected facts and a useful organization.
Use written words and phrases to achieve the purpose	WR-04, WR-05, WR-08, WR-09: usable requests and factual records.
Choose appropriate language and style	WR-06, WR-12, WR-13: tone and detail fit the reader.
Choose appropriate format	WR-07, WR-10, WR-11, WR-16: forms, steps, tables and messages support the task.
Review and revise	WR-14, WR-15, WR-17, WR-18: source checks, feedback and traceable changes.

Local feedback can be **Not observed**, **Not yet demonstrated**, **Demonstrated with support** or **Demonstrated independently**. Record transfer to a new situation separately. These are learning descriptions, not official proficiency levels. Preserve your draft and revision so the progress is visible, including the support that helped you make it.

Source and teaching notes

The six component names come from the supplied SkillPlan *Skills for Success Get Started Guide for Practitioners*, revised March 2024, PDF/printed page 54. Page 55 discusses document-use integration; pages 56–57 support meaningful, audience-focused writing and revision; page 58 describes an explicitly taught writing process; page 59 addresses assessment; page 61 gives contextual message, form and procedure examples. This chapter's case records, prompts, messages and answer models are original teaching materials, not copied employer documents or validated assessment instruments.

Numeracy • Find the quantities, choose a method, explain the result

Start with a useful question

Numeracy helps you answer questions that matter: Will the supplies cover everyone? Which travel plan meets the arrival time? How much space is available? What does a table actually tell us? Getting a number is part of the work. Knowing what that number means, checking it and explaining its consequences complete the task.

You may already estimate quantities, compare prices, organize time, follow a score, count materials or share costs. You can build from those strategies. You do not need to describe your finances, household, cultural responsibilities or employment history to practise here. Every project, price, timetable and dataset in this chapter is invented. Use the supplied cases or agree on another non-sensitive classroom example with your instructor.

Try a task before checking the answer guidance. Keep a record of your method, including a sketch or spoken explanation recorded by the instructor if that works better for you. A calculator, counters, larger print or a spreadsheet can support the reasoning. Record the support you used. A correct calculator display still needs the right question, inputs and interpretation.

Six connected parts of numeracy

The supplied SkillPlan guide names these six components on page 62. This chapter turns them into a repeatable working routine.

Component	What it looks like in your work
1. Identify the task that requires you to use numeracy	State the decision or question and the form of answer needed.
2. Identify the mathematical information	Find quantities, units, dates, conditions and missing information.
3. Make connections between related pieces of mathematical information	Link the available information to the unknown, including information in another table or note.
4. Apply mathematical operations and tools you will need to answer the question	Choose and carry out a suitable calculation, measurement, comparison or display.
5. Interpret and evaluate the information	Check whether the result makes sense and what the evidence can support.
6. Share the mathematical information, results and implications	Explain the result, method, assumptions and consequences clearly enough for another person to use.

You can move back and forth through this routine. A result that seems too large may send you back to the units. An unclear question may require clarification before calculation. That is useful checking, not failure. Separate “I do not yet have this information” from “I have the information but need help choosing a method.” Each calls for a different next step.

Before calculating, make a rough prediction. For example, three packs costing about nine dollars each will cost about twenty-seven dollars. An exact result near that estimate is plausible; a result of two hundred and seventy dollars needs investigation. An estimate does not replace a required exact total, but it gives you an independent check.

Case document A • Supplies for a classroom project

Fictional training order: Willow Reach information project, version 1. The Town of Willow Reach is the fictional road owner and Pathway Paving is the fictional contractor in the wider practice case. This order is for classroom materials used to explain that project. It is not an order for road-building equipment or a real purchasing instruction.

Eighteen learners will prepare information folders. Each learner needs one folder, two pens and three labels. The group also wants two spare folders, four spare pens and six spare labels. The supplies cupboard contains seven usable folders, nine usable pens and sixteen usable labels. These counts have already been checked for this invented task. The spare quantities are additional to the learner quantities.

The practice supplier sells complete packs only. The listed prices already include every tax used in this classroom example; do not add another tax. The goods subtotal determines delivery: an order of at least $60 has no delivery charge; an order below $60 has an $8.50 delivery charge. The available budget is $65 for goods and delivery together. No pickup arrangement, discount or alternative supplier has been provided.

Item	Quantity in one pack	Price for one pack
Folders	5	$8.75
Pens	12	$6.60
Labels	20	$4.20

The purchasing note must state what is needed, what is already available, how many whole packs to obtain and whether the total fits the budget. An order should not be described as approved merely because someone has calculated it. Where a condition is unresolved, identify the question for the instructor acting as project coordinator.

NU-01 • State the task before calculating

Read document A and write a two-sentence task statement. Identify the decision the coordinator needs and the units your answer will use. Then sort these details into **needed now**, **background** or **not supplied**: learner count, contractor name, usable stock, pack prices, delivery conditions and permission to collect an order. Explain why a missing permission cannot be replaced with a convenient assumption.

NU-02 • Connect learners, spares and stock

Make a table with three rows: folders, pens and labels. Add columns for learner quantity, spare quantity, total target, existing stock and additional quantity needed. Complete the target and additional quantities. Before working exactly, predict which item needs the most individual pieces added. Point to the two parts of document A you had to connect. Explain why subtracting stock before adding the spare target could hide a requirement.

Whole packs, fractions and money

A pack count is different from a piece count. If thirteen more folders are needed and each pack holds five, `13 ÷ 5 = 2.6 packs`. The supplier does not sell 0.6 of a pack, so this order needs three whole packs. Rounding down would leave a shortage. In another task, such as counting complete kits that can be made from limited stock, rounding down might be necessary. The purpose decides the rounding direction.

Money calculations need a clear order. First find each line cost, then add the goods subtotal, then apply the stated delivery condition. Do not compare the budget with a subtotal that leaves out a required charge. Keep cents through the calculation. These prices are exact classroom inputs, so round a final money amount to cents only when an operation produces more than two decimal places.

Worked example 1 — folders. Eighteen learners need eighteen folders. Add two spares: `18 + 2 = 20 folders`. Seven already exist: `20 − 7 = 13 more folders`. Whole packs: `13 ÷ 5 = 2.6`, so buy three packs. Cost: `3 × $8.75 = $26.25`. Check the quantity: `7 + 3 × 5 = 22 folders`, two more than the target of twenty. Check the money: three packs at roughly nine dollars suggest roughly twenty-seven dollars. Both checks support the result. Report “three packs, $26.25, providing two folders beyond the planned target,” not simply “2.6.”

NU-03 • Work out the pen order

Use the folder example as a model, but calculate the pens yourself. Show the learner requirement, spare requirement, target, shortage, whole-pack count, cost and final quantity available. Explain the difference between the four planned spare pens and any additional pens created by buying complete packs. Check the quantity using multiplication and addition after you have calculated the pack count.

NU-04 • Complete and evaluate the order

Calculate the label order independently. Then use the folder, pen and label costs to find the goods subtotal, applicable delivery charge and complete order cost. Compare the complete cost with the $65 budget and state the size of any surplus or shortfall. A note says, “The goods cost less than $65, so the order fits.” Correct that note with evidence. Do not invent a discount or permission to omit required supplies.

A fraction compares a part with a defined whole. Seven existing folders out of a target of twenty is `7/20`. Dividing gives `0.35`; multiplying by one hundred gives `35%`. These are three ways to represent the same share. The denominator must be the relevant whole, not a number chosen because it is nearby in the document. “We already have nine pens and seven folders” does not tell us which requirement is better covered because the target quantities differ.

NU-05 • Compare shares fairly

Find the share of each target already covered by stock for folders and pens. Give each as a fraction and a percentage. Which target has the larger share covered, even though the other item has more pieces in stock? Explain the role of the whole in your comparison. Use a strip divided into twenty or forty equal parts, a calculator or another clear representation to check your reasoning.

NU-06 • Respond to a changed quantity

Version 2: The learner count rises from eighteen to twenty-two. Each learner's quantities, spare quantities, stock, pack sizes, prices, delivery rule and $65 budget stay the same. Recalculate the three whole-pack counts and total order cost. Identify which lines change and which stay unchanged. Give the coordinator a concise revised report, including the budget consequence and one decision that still needs their direction. Keep version 1 visible so the change can be checked.

Case document B • A training visit timetable

Fictional travel plan, one practice day. A learner is travelling from the fictional South Stop to a training room. Registration must be reached by 08:45. The workshop starts at 09:00 and ends at 15:20. There is an eight-minute walk between Training Stop and the room. The planning instruction adds a ten-minute buffer after the planned walk and before the registration deadline. The buffer is a classroom planning allowance, not a promise about real service reliability.

The learner must change services at Central Stop. Times in the table are for this invented exercise and do not describe a B.C. transport service. A connection is possible only when the first service arrives before the second leaves. No other outbound departures are available in this document.

Outbound service	Leaves	Arrives
A: South Stop to Central Stop	07:10	07:45
B: South Stop to Central Stop	07:40	08:15
C: Central Stop to Training Stop	08:00	08:25
D: Central Stop to Training Stop	08:25	08:50

After the workshop, the same eight-minute walk returns the learner to Training Stop. The return service leaves at 15:40 and reaches Central Stop at 16:05. The next service leaves Central at 16:20 and reaches South Stop at 16:55. For the exercise, each vehicle boarding costs $2.50. A fictional $8 day pass covers all four boardings on that day. There are no additional fares or discounts in this case.

The coordinator asks for a workable outward journey, the expected return time and a fare comparison. They also want the learner to identify conditions that a real travel plan would need to confirm, such as current schedules and accessible travel arrangements. No one needs to disclose their actual address or travel needs to solve the case.

Read time as time

Clock minutes use groups of sixty. From 08:25 to 09:00 is thirty-five minutes, not seventy-five. A decimal hour uses a different representation: half an hour is `0.5 h`, which is thirty minutes. When a document says `1.30 h`, you need to know whether the writer means one hour thirty minutes or 1.30 decimal hours. Clear reporting avoids that ambiguity by writing `1 h 30 min` or `1.5 h`.

Worked example 2 — a return journey. The workshop ends at 15:20. Add the eight-minute walk to reach Training Stop at 15:28. The wait for 15:40 is twelve minutes. The first vehicle journey takes twenty-five minutes, the Central wait takes fifteen minutes, and the final journey takes thirty-five minutes. Total: `8 + 12 + 25 + 15 + 35 = 95 minutes`, or `1 h 35 min`. Check directly: 15:20 to 16:20 is sixty minutes, then another thirty-five reaches 16:55. The report should name both the final clock time and the elapsed duration.

NU-07 • Choose a feasible outward journey

Find the latest listed departure from South Stop that allows the learner to meet registration **including** the eight-minute walk and ten-minute buffer. Name both connecting services. Show arrival at Training Stop, arrival at the room and the end of the buffer. Explain why the later South departure does or does not work. This is a question about stated constraints, not simply about the shortest ride.

NU-08 • Check elapsed time another way

For the feasible outward journey you chose, calculate the Central waiting time and total elapsed time from South departure to room arrival. Add the return journey's elapsed time to find the combined outward-and-return journey time. Include travel and waits within those journeys; exclude all time in the room before the 09:00 workshop, including the planning buffer, and exclude the workshop itself. Report hours and minutes. Correct this claim: “Eighty-three minutes is 1.83 hours.” You may show a timeline, grouped minutes or a calculator conversion.

NU-09 • Compare like-for-like fares

Calculate the cost of four separate boardings and compare it with the day pass. State the saving and the assumptions that make the comparison valid. Then consider a different learner who needs only two boardings that day. Which option costs less for that learner, and by how much? Explain why “the pass is always cheaper” is not supported by the supplied prices.

NU-10 • Update a plan without losing its conditions

New notice: Registration is now due by 09:10 and the workshop starts at 09:20. Everything else in document B stays unchanged, including the ten-minute buffer and the workshop end time. Recheck the later South departure. Prepare a short revised journey note with service letters, room-arrival time, buffer-end time, registration margin and fare choice for four boardings. Identify one real-world fact the fictional timetable cannot verify.

Case document C • A classroom information board

Fictional layout brief. A learning room is preparing an information board using paper cards. The board is a rectangle 600 mm wide and 400 mm high. The first layout requires a clear margin of 25 mm on every edge. Each information card is 180 mm wide and 110 mm high. Cards must keep that orientation. Leave a 20 mm gap between neighbouring cards, horizontally and vertically. The 20 mm rule applies only between neighbouring cards; no additional 20 mm gap is required at an outside edge.

All dimensions are nominal design inputs for this exercise. They are not measurements of the printed page. Printing or screen zoom can change a diagram's physical size. Use the labelled values for calculations. If you practise measuring an actual classroom object, use a suitable real measuring tool and record the unit and precision; do not assume this workbook prints at a particular scale.

The board will explain four fictional practice-session categories. The visitor table counts thirty-six invented visitors, with each person assigned to only one category. It is a complete table for this exercise, not a survey of an actual community. The instructor asks for a neat arrangement, a simple chart and a short explanation of what the chart supports.

Practice-session category	Fictional visitors
Orientation	8
Trades preparation	12
Service roles	6
Community project planning	10

Later, the instructor may change the margin requirement. Keep the original layout and calculations so a revision can be compared. The task concerns paper information design. It does not establish structural design, accessibility compliance or a safe installation method for a real board.

Measure the quantity the task actually asks for

Length, perimeter and area answer different questions. Length describes a single dimension. Perimeter is the distance around a shape. Area describes the surface covered. A rectangle's perimeter is `2 × (width + height)`, while its area is `width × height`. Label perimeter in a length unit such as metres and area in a square unit such as square metres. The same numbers can produce both calculations, but the results are not interchangeable.

Changing units also requires attention to the quantity. Because `1 m = 1,000 mm`, 600 mm is 0.6 m. For area, one square metre contains `1,000 × 1,000 = 1,000,000 square millimetres`. Dividing a square-millimetre area by only one thousand produces an incorrect conversion. A sketch of a one-metre square can help explain why two dimensions change.

Worked example 3 — the clear inside rectangle. The board loses a 25 mm margin on both the left and right: `600 − 25 − 25 = 550 mm`. It also loses the top and bottom margins: `400 − 25 − 25 = 350 mm`. The clear area is `550 × 350 = 192,500 mm²`. Converting the sides first gives `0.55 × 0.35 = 0.1925 m²`, which agrees with

`192,500 ÷ 1,000,000`. Check that the clear area is smaller than the whole board. Do not subtract the margin only once from each dimension.

NU-11 • Identify units and precision

Convert the board width and height to centimetres and metres. Rewrite the 20 mm gap in centimetres. Explain why measuring the drawing on a resized screen would not establish these dimensions. If you have a real ruler, measure a plain classroom sheet's width to the nearest millimetre and record your method; otherwise describe where zero and the endpoint would need to align using the supplied board values. Keep actual measured data separate from nominal case dimensions.

NU-12 • Choose perimeter or area

Calculate the whole board's perimeter in metres and its area in square metres. Then calculate the total area of four information cards and express it as a percentage of the whole board area. Explain which result could describe the amount of surface covered and which describes the distance around the board. Check that the card coverage percentage is below 100% without relying only on the calculator display.

NU-13 • Test fit, not just total area

Using the original margins, work out how many cards fit across and how many fit down. Include only the gaps between cards: two cards have one gap, three cards have two. Find the total number of cards in a rectangular arrangement. Show why a proposed three-column layout fails even if the cards' combined area seems small enough. Draw a labelled sketch that another learner can check without measuring your drawing.

NU-14 • Read a different unit system

A separate fictional paper strip is labelled **6½ inches**. Use the exact conversion `1 inch = 25.4 mm` to calculate its length in millimetres. First rewrite 6½ as a decimal. A second strip is **¼ inch** wide; convert that width too. Explain why multiplying by 25 rather than 25.4 would be an approximation. These labels are supplied values, not a claim about the physical size of any printed illustration.

Turn data into a message

A useful graph has a question, a title, clear category labels and a scale. A bar chart compares category amounts well. Start its count axis at zero so the visual lengths represent the quantities fairly. Equal steps on the axis must mean equal numerical changes. A picture with attractive bars but no units may leave the reader unable to tell whether the values represent people, dollars or minutes.

A percentage also needs its population and period. “One third chose trades preparation” means one third of these thirty-six fictional visitors, not one third of all learners or all Indigenous people. A count can describe this dataset without explaining why someone attended or predicting demand next year. Sharing a result includes saying what remains unknown.

NU-15 • Make a chart that can be checked

Total the visitor counts. Create a bar chart on paper or with a digital tool using an axis from zero to twelve in steps of two. Include a title that says the data are fictional. Calculate the share represented by Trades preparation as a fraction and percentage. Write two supported comparisons and one conclusion the table cannot support. If using a tool, check its chart against the original table; paper work demonstrates the numeracy task without claiming Digital evidence.

NU-16 • Recalculate after a layout change

The instructor changes every outside margin from 25 mm to 10 mm. Card orientation, card dimensions and 20 mm between-card gaps stay unchanged. Calculate the new clear width and height. Test the number of cards across and down, then compare capacity with the original arrangement. Explain why increasing clear area alone is not enough to establish that a particular arrangement fits. Report both the new count and its conditions.

NU-17 • Transfer the checking routine to a purchasing choice

Return to document A, version 1 with eighteen learners. The coordinator now permits **one extra pack of labels** because they will be used at the next session and storage is available. Compare the original minimum-quantity delivered order with an order containing that additional pack. Reapply the delivery rule and find the total difference. Does the revised order fit $65? Explain the trade-off: spending more on goods can sometimes reduce the final charge, but buying unneeded goods is not automatically a saving.

NU-18 • Make a numerical handover

Choose your revised journey, revised board layout or revised supply order. Prepare a handover containing the question, relevant inputs, method, checked result and implication. Include one uncertainty or condition and show how another person could check the result. Your partner or instructor restates the recommendation; correct any misunderstanding. Finally, identify a specific mistake you corrected or a checking strategy you strengthened, using evidence from your working rather than a general claim about being “good” or “bad” at maths.

Practise with a suitable amount of support

Start with a preformatted table, a number line, fraction counters or an instructor modelling one step. Then try a related item with fewer prompts. If a whole case is too much at once, complete its quantities before its costs, or its arrivals before its fares. Keeping the purpose visible helps you reconnect the parts. For an extension, explain a second valid method or show what additional information a real task would require.

A partner can ask questions and compare methods, but keep individual evidence of your reasoning. Explain an operation before entering it into a calculator. When two results differ, compare the task, source values, units and steps in that order. Repeating the same calculation without identifying the disagreement may simply repeat the error. Feedback should name the useful action: “You checked both margins,” or “The delivery condition still needs applying.”

Your local feedback record can distinguish **Not observed**, **Not yet demonstrated**, **Demonstrated with support** and **Demonstrated independently**. An attempt with an error is different from a task nobody has observed. These descriptions are not official Skills for Success proficiency levels. Application in a different context is recorded separately as transfer, with the new task and evidence named.

Component and evidence map

Component	Main evidence in this chapter
1. Identify the task	NU-01 states the decision; NU-07 identifies deadline constraints; NU-12 selects the required quantity.
2. Identify mathematical information	NU-02 extracts quantities; NU-07 reads the timetable; NU-11 identifies units and precision.
3. Connect related information	NU-02 links people, spares and stock; NU-04 joins pricing and delivery; NU-13 connects dimensions and gaps.
4. Apply operations and tools	NU-03–NU-06 calculate packs, money and shares; NU-08–NU-09 calculate time/fares; NU-12–NU-16 calculate and display measurements/data.
5. Interpret and evaluate	NU-04 challenges a subtotal claim; NU-13 tests actual fit; NU-15 limits conclusions; NU-17 compares complete costs.
6. Share results and implications	NU-06 and NU-10 report revisions; NU-15 explains a chart; NU-18 gives a checkable handover.

Source and teaching-design note

The six component names and numeracy framework come from the supplied SkillPlan *Skills for Success Get Started Guide for Practitioners*, revised March 2024, PDF/printed page 62. Use page 62 for component 6; the table on page 63 repeats the operations heading in that position, while its sharing example concerns communication of results. Teaching choices draw on contextualized numeracy and support pages 64–65, collaborative explanation and feedback pages 66–67, and measurement/data-display examples page 70. The guide's page 68 cautions about preliminary proficiency alignment; this chapter assigns no official level. All case documents, questions and worked examples here are original teaching designs. They have not been presented as community-approved material, real industry statistics or certification assessments.

Digital • Keep information useful, findable and in your control

Digital skill means choosing and using devices, tools and information for a purpose. It includes finding a document, checking whether it answers your question, creating something useful, protecting information and learning a changed tool. Being quick on one app does not mean you must already know every other app. The useful question is: what do you need to accomplish, and what support will help you do it?

You may already use digital skills to arrange travel, follow a course, keep in touch, manage a household or support a community activity. You may also prefer paper for some jobs. Both experiences matter here. We begin with familiar actions and make their purpose visible. You can choose an accessibility setting, work beside a partner and ask for a demonstration without giving up control of your own task.

The cases in this chapter concern a **fictional training centre in B.C.** All names, quantities, messages and records are invented. They represent classroom choices, not the procedures of ACCESS, a Nation, a real employer or a public agency. Use a learning ID, not personal records. No activity requires an account password, a purchase, an application submission or sending a message to another person.

Six parts of Digital

The following component names appear in the supplied SkillPlan guide on page 71. The activities develop selected beginner and extending applications of every component; completing them does not establish an official proficiency level.

Component	What it means in this chapter	Main evidence
1. Use digital devices including computers, tablets, smart phones and other handheld devices	Control the available device and adjust a useful setting.	DG-01–DG-03
2. Use common digital tools to complete tasks	Choose a suitable tool and produce a checked document or table.	DG-04–DG-06
3. Use digital information	Find, compare, organize and evaluate information.	DG-07–DG-09
4. Use online tools and platforms	Navigate a public website and use its features for a defined purpose.	DG-10–DG-12, where an actual online turn is available
5. Apply safe and responsible practices online	Recognize requests, manage sharing and protect credentials and other people's information.	DG-13–DG-15

Component	What it means in this chapter	Main evidence
6. Update and upgrade digital skills	Use help, test a new method and retain a learning strategy.	DG-16–DG-18

If internet access is unavailable, the printed cases still support reading, source evaluation and planning. Record online tool use as **not observed** until you have an actual turn. Likewise, your partner's completed spreadsheet is not evidence that you used the tool. Partners can coach; each person needs time controlling the device or their chosen accessible interface.

Begin with a purpose and a comfortable setup

A device is the physical equipment, such as a laptop or tablet. An application is a program used for a task. A file is a saved item, such as a document or spreadsheet. A folder helps organize files. A browser opens web pages and may also show local files. A website is a set of pages provided through the web. These terms help you ask a precise question: “I can open the browser, but I cannot find the file I downloaded” gives a helper a clearer starting point than “Nothing works.”

Before changing anything, notice what is already open. On a shared device, ask which folder and account are designated for classroom practice. Do not browse another person's files. A helpful setting might be text enlargement, display magnification, a different pointer size, captions, keyboard navigation or a screen reader. Settings differ between devices. Ask the instructor to demonstrate an unfamiliar setting and how to return to the previous view. The goal is usable access, not mastering a particular brand's menu names.

DG-01 • Name the task and the controls

Choose one available device. Tell a partner how you would enter text, select an item, move between open applications and return to the main working screen. Demonstrate two of those actions using an empty practice document. Identify the device, application and file separately. If you use voice, switch controls or another access method, demonstrate the equivalent actions. The partner records what you actually did, not how fast you did it.

DG-02 • Make one useful adjustment

Choose a setting that could help with this chapter, such as enlarging text or turning on captions for a demonstration. Predict what it will change, make the adjustment with support if needed, and test it. Explain whether it helped. Show how you would restore the previous setting or ask the device owner before leaving it changed. This is a practical choice; you do not need to disclose a diagnosis or justify an access need.

DG-03 • Create a place to work

In the approved practice location, create a folder named `IS4S-practice-[learning-ID]`. Create a document named `digital-notes-v01` inside it. Add the date and one sentence about a digital task you want to practise. Save, close and reopen it from the folder. Point out the difference between the file name and its location. If the application saves automatically, identify the saved location and check that your latest sentence appears after reopening.

Case document A • A record the next person can trust

Fictional centre request — Equipment learning cards, version 1

The training team is preparing classroom cards for an introduction to asphalt paving. The cards explain equipment purposes; they contain no operating instructions. The coordinator needs a record showing how many card sets are ready and how many still need checking.

At the start of the afternoon, the table below is the agreed record. “Checked” means a classroom reviewer compared the printed labels with the approved lesson sheet. It does not mean equipment has been inspected or a learner has earned a technical qualification. The coordinator asks for a clear title, the three topic names, totals and a note identifying the record as fictional practice data.

Another learner will use the file tomorrow. They need to find the latest version without guessing whether “final,” “new-final” or “really-final” is correct. The practice folder is shared only with the instructor and your assigned partner. No public link is needed.

Classroom card topic	Sets prepared	Sets checked
Material flow	8	5
Equipment purposes	6	4
Road users	10	7

A word-processing document is useful for paragraphs and a simple display table. A spreadsheet is useful when you need repeated calculations and updates. A presentation tool helps organize material for an audience, but it may be awkward for a record that must be sorted and recalculated. Choosing a tool begins with the task, not with the most impressive feature available.

Worked example 1 • Build a small, checkable table

Open a blank spreadsheet. Put the headings in row 1: **Topic**, **Prepared**, **Checked**, **Remaining**. Enter the three source rows in rows 2–4. In D2, subtract checked sets from prepared sets: `=B2-C2`. The first result should be 3. Use the same relationship for the next two rows. The remaining values are 3, 2 and 3.

In row 5, label the first cell **Total** and total each number column. For example, `=SUM(B2:B4)` totals prepared sets. The answers are 24 prepared, 16 checked and 8 remaining. Check the relationship `24 – 16 = 8`. This second check would catch some entry or range errors. It does not replace checking every source row. A formula can calculate the wrong entries perfectly.

Give the sheet a descriptive title. Keep numbers as numbers; explain their meaning in headings. Save a first version and reopen it. The useful result is a readable, retrievable record whose values agree with the supplied document. A screenshot alone may hide formulas or make later editing difficult, so keep the editable file as well as any display copy.

DG-04 • Choose and explain a tool

Choose a tool for each task: a two-paragraph visitor note, the card-count record, and a three-screen explanation for a class discussion. Explain one useful feature and one limitation of each choice. A single tool may handle more than one task. Your reason must refer to the reader, calculation or update needed, not simply “I like this app.” Compare your choice with a partner's and retain any justified difference.

DG-05 • Build and check the record

Create the four-column table from Case A. Enter and check every row, calculate remaining sets and add totals. Show the instructor one formula or your alternative calculation method. Add a note saying **Fictional classroom data — not an equipment inspection record**. Save the editable file as `card-record-v01-[learning-ID]`. Explain why a prepared set and a checked set are not the same thing. If using a table tool without formulas, show your calculations separately and label totals clearly.

DG-06 • Make a usable second version

A reviewer checks two more **Road users** sets; no new sets are prepared. Update the checked value from 7 to 9 and save a second version. Record what changed and who made the practice update using your learning ID. Check the new totals and remaining count. Show both versions, identify the current one, and explain how a future reader would know which to use. Do not delete the earlier version until the exercise review is complete.

Find and judge information before using it

Searching is a sequence of decisions. First identify the question. Then choose terms that describe the topic, location and type of source. Open a result and examine the actual page. A result title or preview can be incomplete, outdated or unrelated to the part of the page you need. Record the title, publisher, date or version if shown, and the location of the information that answers your question.

A relevant source can still have limits. A historical training outline may accurately describe what was included in that version, while not proving today's entry requirements. A government page can be authoritative for its own program without answering a particular employer's procedure. A post that repeats someone else's claim may not show where that claim began. Ask both “Who is responsible for this information?” and “Does this information answer my actual question?”

Digital information also includes tables, images, diagrams, audio and video. An image without labels may be difficult to interpret. A video may need captions or a transcript. A document may look official but contain an old revision date. These are reasons to investigate, not reasons to dismiss every unfamiliar source. You can keep a question open while finding better evidence.

Case document B • Two messages, different evidence

Practice notice A — undated social post

“The paving course is open to everybody next week. No need to check anything: all training is free, and everyone who attends gets fully qualified. Share this with all your contacts.” The post names no provider, intake, eligibility rule, credential or contact. A decorative logo appears, but the page gives no source link.

Practice notice B — fictional training-office draft, dated 6 May 2027

“We are collecting expressions of interest for an introductory classroom session about asphalt paving. This notice does not confirm a place, tuition arrangement or trade qualification. Contact the training office through its published directory before making travel arrangements. The coordinator will confirm dates, access supports and any documents needed. Do not put identity documents in a public comment.”

These notices are supplied classroom texts. Neither is a real intake announcement. Notice B gives clearer limits, but its fictional status means it cannot establish a real course opportunity. A careful reader can recognize better information practices without treating the example as current program information. This distinction matters when digital material looks polished or uses a familiar organization's name.

Worked example 2 • Turn a broad search into a useful question

The first question is “How do I get a paving job?” That could involve training, vacancies, applications, experience or certification. For this chapter, narrow it to: **Where can I read the official description of the nine Skills for Success?** Search terms such as `Government of Canada Skills for Success nine skills` identify the topic and likely publisher. Open the publisher's page, check the page title and domain, and locate the skill descriptions.

The source record might contain: **Question; page title; publisher; web address; date accessed; relevant section; what remains unanswered.** The final field matters. A description of Digital does not establish the admission requirements of a particular B.C. course. A useful search ends with an answer bounded by the source, not a claim that the page solves every related question.

DG-07 • Evaluate the two notices

For each notice, identify the purpose, the claims supported by its text, the missing information and a sensible verification step. Explain why a logo and a confident tone do not establish a qualification claim. Rewrite the first notice's “everyone gets fully qualified” claim as a question to the actual provider. Do not invent the provider's answer. Your response can be spoken, written or organized in a table; the focus here is evaluating information.

DG-08 • Retrieve the right version

In your practice folder, locate the two card records. Use a file view, search feature or another accessible method to find the second version. Open it and confirm the changed Road users value. Record the exact name and location in `digital-notes-v01`. Explain how you checked the content rather than relying only on a file's

name or “recently opened” position. Show the instructor the route you used; a partner can describe it afterward as a check.

DG-09 • Make a source record

Choose either a supplied training PDF or an instructor-selected public page. Record its title, responsible organization, version/date if available, location and one specific fact it supports. Add one question it does not answer. If no date is visible, write **date not found** and identify where you looked. For a PDF, include the viewer page; for a website, include the relevant section. Keep quotations brief and distinguish them from your own paraphrase.

Use online tools with a clear boundary

Online work often requires several linked actions: entering a query, selecting a result, moving through a page, using a search or navigation feature and keeping a record. An internet connection and the right page address are separate from an account. Many public information pages can be read without signing in. These exercises use public information and do not ask you to create an account or disclose personal details.

Before opening a link, notice the displayed destination when your device makes it available. A message's visible words and its actual link can differ. On a real page, check the address after any redirect. The presence of `https` means the connection uses encryption; it does not by itself prove that a claim is correct or that an organization is the one you intended to visit. Use a known official starting point when checking an unexpected message.

An online form can save a draft, send information or commit to a transaction. Those are different actions. Read the button and any explanation before selecting it. In this chapter, any form practice must be an instructor-controlled dummy form or a paper mock-up. Use only fictional content. Stop before a real submission, booking, payment or public post; classroom practice does not require that action.

DG-10 • Navigate an official public page

With an actual internet connection, open the Government of Canada Skills for Success page, or an equivalent instructor-approved official page if its structure has changed. Locate the skill descriptions using the page's navigation, browser find or an accessible alternative. Show the page title, web address and the Digital description. Record the access date and your route. If access is blocked, record that limitation and use a supplied copy for content practice; return for a live online turn later.

DG-11 • Search, compare and keep the boundary

Use a search feature or search engine to find an official explanation of one other Skill for Success. Open a relevant result and compare its publisher and topic with DG-10. Record the search terms, selected page and reason for choosing it. Identify one unrelated or less useful result if one appears, explaining why it does not answer your question. Do not click a suspicious result simply to demonstrate rejection. If only one usable result is available, explain what a second source would add.

DG-12 • Share a route without sharing private information

Create a short digital instruction that another learner could use to reach the official skill information: starting address, navigation steps, target heading and one check. Test it with a partner using their own browser turn. Improve one unclear step. Keep the instruction as a local document; no external message needs to be sent. Distinguish your creation of the instruction from the partner's online navigation, and record each person's evidence separately.

Case document C • A request that needs checking

Fictional message received in a classroom simulation

“URGENT: Your training place will disappear in ten minutes. Reply with your account password and a photo of your identity document so we can protect it. Click the attached form now. Do not call the office because the phone line is too busy.” The display name says **Training Support**, but the sender address does not match the office address in the classroom contact sheet. The message supplies no course reference.

The contact sheet says learners should use the published office number or established course contact for enrolment questions. The fictional office has not announced any new verification process. Your partner suggests forwarding the message to the whole group to warn everyone. Another learner suggests checking through the known contact first and sharing only a description of the concern with the instructor.

The message uses urgency and requests sensitive information. Those are reasons to pause and verify independently. Do not reply with a password, follow the unexpected link or forward an identity document. In this classroom task, tell the instructor what you noticed and use the supplied contact route. In a real setting, follow the organization's reporting process. If you have already entered information into a suspicious page, seek prompt help through an independently verified support route; the right recovery steps depend on the account and organization.

Password practice should never involve sharing a real password with the class. Discuss principles using invented examples. Different accounts should have different credentials, and a supported password manager can help where the organization permits it. Multifactor authentication adds another verification step where available. An unexpected sign-in approval request should not be accepted merely to make the prompt disappear. Follow the service's current guidance and ask a trusted support person if the process is unfamiliar.

Worked example 3 • Decide what a recipient needs

The task is to let a partner review card totals. They need topic labels and counts. They do not need your home address, identity documents, personal learning history or another learner's contact details. Make a copy containing only the required classroom information. Check its title, comments and visible content. If an approved sharing tool is used, select the intended recipient and minimum useful access, such as viewing rather than editing when revision is unnecessary. Confirm the setting before completing the action.

For our local practice, put the review copy in the instructor-approved class folder or show it directly on the device. Explain what would need checking before online sharing. A discussion of permissions is evidence of reasoning; actually setting permissions in an approved tool is separate evidence of performance. Do not claim to have tested a public link when you have only described one.

DG-13 • Respond to the suspicious request

Identify four details in Case C that need attention. Give a sequence of actions that avoids sending credentials or identity documents. Explain why replying to the message is different from contacting the office through its independently known route. Draft a short report to the instructor that describes the issue without copying unnecessary personal information. Keep it as a practice draft. No report needs to be sent outside the learning activity.

DG-14 • Make a practice sharing decision

Duplicate the current card-count file for this simulation. Add the reviewer note **Check remaining sets against the current practice version** and a dummy column labelled **personal phone**, containing the literal words **sample only** in each row. Then create a review copy containing only the information needed to check the counts. Remove the unnecessary dummy column and explain the choice. Never add a real phone number. If an approved classroom sharing tool is available, inspect the recipient and access options with the instructor before a dummy-data demonstration. Otherwise, demonstrate the local review copy and record online permission-setting as not observed.

DG-15 • Practise account-protection reasoning

Using no real credentials, explain the difference between reusing one password everywhere and keeping distinct credentials. Describe the purpose of a second verification factor and what you would do with an unexpected approval prompt. Then identify one current help page or approved support route you would consult before changing account security settings. You may use a supplied help-page copy. Do not create or display a real password, recovery code or security answer for this exercise.

Learn the next tool without starting from zero

Digital tools change. A button may move, a file format may differ or a workplace may use another application. Begin with what remains familiar: task, document, data, audience, save location and checking method. Then identify the part that changed. A useful learning note says what you tried, what happened and what you will test next. It does not label you as a “technology person” or “not a technology person.”

Help can come from an instructor, an application's help system, an official support page or a trusted colleague. A useful request includes the task, device or application, the step that failed, the message displayed and the attempts already made. Share a screenshot only when it contains no information that should remain private. You can describe the error instead. Ask before installing software, granting new permissions or changing a shared device's configuration.

DG-16 • Test a second method

Choose one action you already completed: opening a file, finding a word, enlarging text or producing a total. Learn a different supported method through the application's help or an instructor demonstration. Try it on a copy of your practice work. Compare the result with the original method and explain when each might be useful. Keep a short note showing the help source, action tried and result. A change in method counts as useful learning only when you check its effect.

DG-17 • Respond to a changed requirement

The fictional coordinator now needs a PDF view of the current card record for a reader who cannot open your spreadsheet. Keep the editable file and create a separate PDF using the tool's export or print-to-PDF feature. Open the PDF and check the title, all rows, totals and fictional-data label. If a column is cut off, adjust the output and check again. Explain what the PDF preserves and what editing or formula functions it does not provide in the same way as the spreadsheet.

DG-18 • Build a transfer plan from evidence

Choose a new low-risk task, such as keeping a fictional appointment table or finding a public training contact. Name which actions from this chapter would transfer, which part would need learning and what support you would choose. Demonstrate one transferable action on dummy data. In your learning note, identify a strength, an unresolved question and the next practice step. Separate this demonstrated action from any future workplace use you are proposing.

Keep the evidence and choose the next challenge

Your portfolio can contain the two card records, a source record, a navigation instruction, a review copy, an exported PDF and a short learning note. The instructor also needs observations of your actual device and online actions. Choose **Not observed**, **Not yet demonstrated**, **Demonstrated with support** or **Demonstrated independently** for each stated task criterion. Record the support used. These descriptions are local feedback, not official Digital levels.

For supported practice, use a prepared folder, large headings, a partially completed table and one demonstrated step at a time. For extension, use a second application, compare two official help routes or improve the navigation instruction after a different reader tests it. Increase the challenge by changing information, tool or audience, not by removing access supports that make the task usable.

Teaching-source connection: SkillPlan, *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp.71–77: six Digital components, starting-point assessment, relationship-centred support, contextual problem-based tasks and formative evidence. The cases, activity sequence and wording here are original ACCESS IS4S adaptations. The source's page 77 password activity contains unrelated numeracy tips; this chapter replaces those tips with relevant credential and sharing practice. The public Canada.ca page is a live-practice destination, not evidence of any particular course's admission or certification requirements.

Problem solving • Understand the issue, choose a response, check what happened

Problem solving is a process for making a decision when the next step is uncertain. It includes finding out what is happening, gathering useful information, considering more than one response, acting within your role and checking the result. It does not require having an instant answer. Sometimes the soundest next step is a specific question, a small test or a request to someone with the right responsibility.

People bring experience from work, learning, family and community responsibilities. That experience can suggest useful possibilities. It can also lead us to expect that a new situation has the same cause as an earlier one. In this chapter, experience is a starting resource, and evidence helps decide how well it fits the present case. You may draw on a personal example if you choose, or use every supplied fictional example without sharing private experiences.

The cases involve classroom scheduling, learning documents and a community information display. They use invented B.C. training situations, not the affairs of a Nation, employer or actual ACCESS cohort. There is no live equipment troubleshooting. When a real problem concerns machine safety, harassment, legal obligations or someone's immediate wellbeing, involve the responsible qualified person or established support process. A classroom decision exercise does not give a learner authority to resolve every kind of problem alone.

Six steps that can loop back

The component names below follow SkillPlan's supplied guide, page 78. You may return to an earlier step when a new fact changes the picture. Returning to gather information is progress when it prevents an unsupported decision.

Component	Practical question	Main chapter evidence
1. Identify the issue to be addressed	What is happening, to whom, and what needs to be different?	PS-01–PS-03
2. Gather information to help you address the issue	What do we know, need to know and need help to establish?	PS-04–PS-06
3. Analyze the issue	Which explanations fit the evidence, and which are still guesses?	PS-07–PS-09
4. Develop multiple routes of action	What different responses could meet the actual needs?	PS-10–PS-12
5. Address the issue	What will we do, who is responsible and what needs permission?	PS-13–PS-15

Component	Practical question	Main chapter evidence
6. Evaluate the effectiveness of the solution or decision	Did the response help, for whom, and what should change next?	PS-16–PS-18

Use a simple record throughout: **issue; known facts; missing information; options; chosen action and reason; result; next step**. A drawing, voice note, table or supported written record can help you hold the process in mind. If the instructor is observing Problem solving, the quality of the reasoning matters separately from spelling, handwriting or confidence when speaking.

Define the issue without defining a person as the problem

“The learners do not care” is an interpretation of people. “Four of ten card sets used an older heading” is an observation that can be checked. The second statement gives a starting point for useful questions: which file was available, what instruction was given, how was the version shown, and when was the check made? A clear statement does not pretend people never make mistakes. It makes it possible to investigate the situation without beginning with an unsupported judgement.

Include the gap between present and needed conditions. Name the affected work and a boundary. For example: “The group has three working practice devices for ten learners, and each learner needs an individual tool turn within their available time.” That statement is more useful than “We need more money” because money is only one possible route. It also avoids choosing a solution before understanding the requirements.

A problem statement can acknowledge uncertainty: “We do not yet know whether loan devices will open the practice files.” An unknown is not a failure. Hiding it inside a confident recommendation can create a failure later. Put the unknown beside the decision it affects so the person responsible knows why checking it matters.

Case document A • A tool turn for every learner

Fictional planning brief — Thursday practice session

Ten learners need an individual digital practice turn. Each turn includes **20 minutes controlling a device and 5 minutes saving, reopening and checking the file**, so allow 25 minutes per learner. Learners can work simultaneously on separate devices. Allow **5 minutes between groups** to reset the classroom practice files. A partner watching does not count as that partner's own turn.

The original plan uses five devices from 09:00 to 10:00. Two devices have become unavailable for the class. Three remain available. A technician is responsible for the unavailable devices; learners are not asked to repair them.

Three learners must leave at 10:00. The other seven can remain until 11:00. The instructor and room are available until 11:00. Finishing everybody's turn by 10:00 is preferred, but completing a genuine turn within each learner's available time is required. The extra classroom budget is **no more than $50**.

The training office can reserve two compatible loan devices for **$40 total**, if confirmed by 08:30. A later room with six devices costs **$60** and is available only from 10:00 to 11:00. Paper planning materials cost nothing extra and are already printed. All costs, times and arrangements are invented for this exercise.

Worked example 1 • Separate the issue from the first idea

A first reaction is “Buy two new devices.” Buying is a proposed action, not the issue. Read the brief again. The required outcome is an individual 25-minute device turn for all ten learners within their availability and the $50 extra budget. The original five-device plan needs two groups: `25 + 5 + 25 = 55 minutes`, which fits 09:00–10:00.

With only three devices, ten learners need four groups: three, three, three and one. The device time is `4 × 25 = 100 minutes`, with three 5-minute changes: `100 + 15 = 115 minutes`. A four-group sequence can run 09:00–10:55 if the three learners leaving at 10:00 are in an early group. It does not meet the preferred 10:00 finish for everybody, but it can meet the mandatory availability requirement. That difference keeps a potentially workable option open.

PS-01 • Write a bounded problem statement

Write one or two sentences describing the issue in Case A. Include the learners affected and the required outcome. Leave out a preferred solution. Underline the information that comes directly from the brief and mark anything you are assuming. Explain why “the group is too large” does not yet identify the decision the coordinator needs to make.

PS-02 • Distinguish requirements from preferences

Make two columns: **must meet** and **prefer if possible**. Sort the individual tool turn, $50 maximum, each person's availability, everyone's 10:00 finish and use of a familiar device. The brief does not explicitly rank familiarity; identify that as something to discuss rather than quietly making it mandatory. Add one question

that would help the coordinator understand learner access needs without asking for private personal explanations.

PS-03 • Identify people and responsibilities

List the learners, instructor, training office and technician. For each, explain one relevant need or responsibility using the brief. Identify who can reserve a loan device and who should address the unavailable equipment. Explain how learners could contribute to the plan without being expected to authorize spending or disclose why they must leave at a particular time.

Gather enough information for the decision

Gathering information is purposeful. You are not required to collect every fact that might exist. Start with the decision and ask which missing facts could change it. A device's colour is unlikely to matter here. Its ability to open the practice file, accessibility settings and reservation deadline may matter. Distinguish confirmed information from a suggestion that still needs checking.

Useful questions are specific and answerable. “Will this work?” can mean several things. “Can the two loan devices open the practice spreadsheet, and can we confirm the needed access settings before the session?” identifies what must be checked. A question about availability can allow a simple yes/no answer without asking someone to explain family, health, transport or community responsibilities.

Keep source and date beside important information. A room that was free yesterday may have been booked today. A remembered price may exclude an additional charge. For a real decision, use the responsible person's current confirmation or the current authorized document. The fictional brief gives fixed facts for this exercise; do not silently import a real provider's prices, policies or rules into it.

PS-04 • Create an information checklist

Make a checklist for comparing the three-device plan with the loan-device plan. Include information already supplied and at least three questions that could matter before real delivery, such as required access settings, how loan devices reach the room and who confirms the reservation. Mark each entry **provided**, **needs confirmation** or **not relevant to this decision**. Do not change the given classroom numbers while identifying real-world checks.

PS-05 • Ask without assuming

Draft three short questions: one to the training office, one to a learner about the usable schedule, and one to the instructor about the required evidence. Use a purpose statement so the person knows why you are asking. Then exchange questions with a partner acting from the brief. Notice any question that asks for information the case does not supply; record it as unresolved rather than inventing an answer.

PS-06 • Organize conflicting information

A fictional sticky note beside the room calendar says, “All learners can stay until 11.” The dated planning brief says three must leave at 10. Explain why choosing whichever statement makes your preferred plan easier is unreliable. Record the conflict, its effect on the schedule, the responsible confirmation route and the temporary assumption you will use until it is resolved. Continue using the brief's three early departures for the remaining classroom calculations.

Analyze causes, patterns and limits

Analysis connects facts without claiming more than they support. It can involve comparing rows, grouping possible causes, noticing a sequence or asking how a process works. A cause-and-effect diagram can group possibilities under headings such as information, tools, time, process and access. Those headings organize questions; they do not prove a cause.

A “why” question is useful when it opens an investigation. It becomes less useful when it forces every answer toward blame. Ask “What made the current version difficult to identify?” rather than “Why did someone ignore the correct version?” Do not keep asking “why” as though a fifth answer must be the truth. Stop at an evidence gap and name what would test the proposed link.

Watch for familiar thinking shortcuts. You might favour the explanation you first heard, notice only examples that support it, or trust the most confident speaker. Counter that by asking what evidence would make you revise your view. Invite a different interpretation before settling on a cause. A partner's question can improve a decision without making either person the winner or loser of a debate.

Case document B • Repeated card-label corrections

Fictional improvement record — classroom print station

During three practice sessions, learners printed ten card sets each session. The review found four sets needing a label correction in Session A, two in Session B and three in Session C. The group did not record each person's name; the purpose was to improve the process, not rank learners.

The instructor observed that both an older practice file and a current practice file were available in the same folder. Their names differed by only one letter. A spoken reminder was given, but no version example was displayed beside the print station. One learner said they selected the first result shown by the file search. Another said they used the file already open on the device. These observations suggest possible links but do not establish the cause of every correction.

For the next two sessions, the instructor placed the current practice file in a clearly named folder and displayed a version-check card. Session D had one corrected set out of ten; Session E had none out of ten. Different learners may have attended, and the record does not measure their prior experience. No comparison group used the old arrangement during the same period.

Session	Sets reviewed	Sets needing label correction	Arrangement
A	10	4	Earlier arrangement
B	10	2	Earlier arrangement
C	10	3	Earlier arrangement
D	10	1	Revised arrangement
E	10	0	Revised arrangement

PS-07 • Build explanations that can be tested

Identify three possible contributors to the corrections in Case B. For each, point to supporting information and state what remains unknown. Include at least one explanation concerning the information or process, not a learner's attitude. Do not claim that everyone used the older file. The record does not say that. Suggest a respectful way to learn more without collecting unnecessary personal information.

PS-08 • Use a cause-and-effect map

Create a map with the issue in the centre: **some printed sets need label corrections**. Use at least three headings such as file organization, instructions, display or checking process. Place known observations and untested possibilities in visibly different styles or labelled columns. Choose one proposed link and write a small, low-risk test. Explain which result would support the link and which would make you reconsider it.

PS-09 • Challenge a conclusion

A fictional colleague says, “The new folder proves that people were careless before.” Explain two problems with that conclusion. Then write a statement supported by the record and a question worth investigating. Compare your response with a partner's. Identify one assumption in your own first explanation that you revised after considering the other person's reasoning.

Develop options before selecting one

Options should be genuinely different ways to address the issue. “Tell people more firmly,” “give a stronger reminder” and “repeat the instruction louder” may be three versions of the same approach. A different option might change the file arrangement, provide a visible example, add a check before printing or allow a different way to access the instruction. Generate possibilities first, then compare their likely effects and constraints.

Mandatory criteria come before preferences. An option that cannot meet a required access need does not become suitable because it is cheap. An option outside the authorized budget needs a new decision by the responsible person; a learner cannot make the limit disappear by giving cost a low score. After checking requirements, compare useful preferences such as time, simplicity, travel or the amount of new learning needed.

A table can make your reasoning visible, but numbers do not make a judgement objective automatically. If you use ratings, explain their meaning and why a criterion matters. Keep uncertain entries marked as uncertain. A precise-looking total based on guessed ratings can hide the question that most needs discussion.

Worked example 2 • Compare the schedule options

For Case A, compare four routes. Two compatible loan devices cost $40 and restore five simultaneous places, so two groups finish by 09:55. Using only three devices costs no extra money and takes 115 minutes; early departures must be placed before 10:00. The later room costs $60, exceeds the stated budget and begins after three learners must leave. Paper-only work costs nothing but does not supply the required digital tool turn.

Two options remain feasible under the supplied facts: loan devices or a longer rotation with three devices. If the coordinator gives high priority to finishing the whole group before 10:00, the $40 loan plan fits that preference. If minimizing extra spending is the priority and a longer rotation is acceptable, the three-device plan can work. The recommendation must explain the trade-off instead of pretending there is only one possible answer.

PS-10 • Generate three routes

For Case B's label-correction issue, propose three different changes. Explain how each could help and what effort or check it would require. At least one option should change the information or workflow rather than relying only on an extra verbal reminder. Include an option proposed by a partner and identify what you learned from it. Do not select the final response until all three have been described.

PS-11 • Build a decision table

Compare the four Case A routes: loan devices, extended three-device rotation, later six-device room and paper-only replacement. Include extra cost, total device-session duration, early-departure access and whether the actual digital outcome is met. Mark required criteria separately from preferences. Recommend either feasible route with a reason based on the brief. If you recommend a route that needs a changed requirement, name the authorization or new information needed before it could become feasible.

PS-12 • Test your preferred option against a drawback

Take your preferred route from PS-11. Identify its strongest drawback and one situation that would make it unsuitable. A partner takes the role of a coordinator and asks one challenging but respectful question. Respond using evidence, or change your recommendation if the question reveals a real gap. Record the reason for keeping or revising the choice. Defending a first idea at all costs is not the purpose of this task.

Address the issue with a workable action plan

A decision becomes useful when someone can act on it. Record the action, responsible role, time, required confirmation and check. “We will communicate better” is too broad. “The coordinator will confirm the two loan devices by 08:30; the instructor will check the practice file before learners arrive; the group list will show each

person's turn” gives people a clearer shared plan.

Keep within your role. A learner can propose, check classroom data and ask questions. Reserving equipment, spending funds or changing a real schedule may belong to a coordinator. A useful recommendation identifies that boundary rather than presenting a classroom suggestion as an approved decision. The same principle applies to community information: permission to learn about a topic is not automatically permission to publish someone's contribution.

Before acting, decide what would trigger a pause or a fallback. If loan devices do not arrive, when should the coordinator switch to the longer rotation? If a printed display contains an unapproved statement, who checks it before the display is used? A fallback should still meet the required outcome or clearly state which part must be rescheduled. It should not quietly lower the standard and call the work complete.

Case document C • A useful display with an unanswered request

Fictional classroom display brief

A group is preparing a public-information display for an open classroom afternoon. It explains the five-stage introductory paving process and how the nine Skills for Success appear in the learning activities. The display uses original learner diagrams and clearly labelled fictional data. The coordinator has approved a one-page explanation of the classroom project.

A visitor suggests adding a local community story and a photograph of participants to make the display more engaging. The group has no permission to use a particular story or photograph. One learner knows a person who might be willing to contribute, but has not asked them. The deadline is tomorrow. The existing approved diagram can be used without those additions.

The group wants an inviting display and respectful relationships. No learner is expected to speak for a Nation or community, reveal personal identity information, or provide cultural material to improve a class product. The coordinator can discuss a later community-directed contribution if the appropriate people choose to participate.

PS-13 • Write the action plan

Create a plan for your feasible Case A route. Include at least four actions, the responsible role, timing and a check. Make the group sequence clear enough to show how all ten people receive 25 minutes, including the three who must leave at 10:00. Identify the decision that belongs to the training office or coordinator. Your plan is a classroom proposal; do not contact or book anything outside the exercise.

PS-14 • Respond to a changed fact

At 08:35, the fictional office confirms that the loan devices are unavailable. Use the supplied room and learner availability to make a fallback plan. Show the four groups and their times, placing the early-departure learners appropriately. Explain what you would tell the group about the changed finish time and what would need reconfirming in a real class. Paper planning can occupy waiting time, but it cannot replace the required device turn.

PS-15 • Make a decision that respects permission

Apply the six-step process to Case C. Identify the immediate display decision, the facts and missing permissions, at least two possible routes and a justified action before tomorrow. Explain how the group could remain open to a future contribution without treating a possible personal connection as permission. Write a short recommendation to the fictional coordinator. Use the supplied case; no learner needs to provide a real cultural story or photograph.

Evaluate results and learn from them

Evaluation asks whether the response achieved its intended purpose, what else happened and what should be done next. Decide what evidence you will collect before trying the change. In Case A, useful evidence includes whether every learner actually controlled a device, whether files were saved and reopened, whether departures were respected and whether the cost stayed within the limit. A full attendance list alone does not answer those questions.

Look at the denominator when comparing counts. One correction out of ten sets is different from one out of a hundred. Keep the observation period and conditions visible. A change seen in a small classroom trial can be promising without proving that the same result will occur in every class. Learner feedback may reveal an access problem that a numerical average hides.

Worked example 3 • Compare the correction record carefully

Before the revised arrangement, Case B records `4 + 2 + 3 = 9` corrections among `10 + 10 + 10 = 30` reviewed sets. The proportion is `9/30 = 0.30 = 30%`. After the change, there is `1 + 0 = 1` correction among `20` sets: `1/20 = 0.05 = 5%`. The difference is **25 percentage points**, because `30% − 5% = 25 percentage points`.

A supported statement is: “The recorded correction proportion was lower in the two sessions using the revised arrangement.” It is too strong to say the folder change alone caused the improvement or that the problem can never return. The record includes different sessions and possibly different learners. Continue checking versions, ask whether the process is usable and review another trial before making a broader claim.

PS-16 • Define success and inspect the evidence

For your Case A plan, write four observable success checks. Then consider this invented result: all ten learners attended; nine saved and reopened a file independently or with recorded support; one learner watched a partner but did not control a device. The cost was $40 and everyone left within their availability. State which criteria were met, which remain unmet and what follow-up is needed. Do not turn attendance into proof of the missing individual turn.

PS-17 • Evaluate and improve the print-station trial

Use Case B's data to calculate the before and after correction proportions. Write a two-sentence interpretation that includes one limitation. Add one question for learner feedback and one next observation that would help evaluate the revised process. Explain why asking whether the folder and version card were usable is different from asking who was careless. Preserve both the numerical result and the people affected by the process.

PS-18 • Transfer the method to a new situation

Choose one supplied new issue: a fictional classroom bus-time notice has two different departure times, or a practice supply list contains an item with no quantity. Apply all six steps using a small invented document you label as practice. Identify at least one fact you would need from the responsible person before acting. Explain which step from this chapter helped most and show the record of your reasoning. A planned future workplace use should be recorded as a plan, not as demonstrated transfer at work.

Your evidence and next practice

Keep the problem statement, information checklist, cause map, options table, action plan and evaluation. These records show how your thinking changed; a final answer alone may hide the strongest part of your learning. You can record a question you left unresolved when the available evidence was insufficient. That is useful evidence of judgement when you also identify an appropriate next step.

For support, work with fewer options, highlight the mandatory criteria, use counters for the learner groups or ask an instructor to model one question. For extension, add one clearly labelled changed fact and test whether the recommendation still holds. Increase the reasoning challenge gradually. The local feedback descriptions are **Not observed**, **Not yet demonstrated**, **Demonstrated with support** and **Demonstrated independently**; record support and transfer separately rather than awarding a made-up official level.

Teaching-source connection: SkillPlan, *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp.78–84: six problem-solving components, explicitly taught models, guided problem-based learning, different perspectives and observed assessment. The cases, calculations, decision criteria and prose here are original ACCESS IS4S learning materials. They do not reproduce the source's deficit-based example about children or treat people as problems to control.

Communication • Make room for the message and check understanding

Communication involves receiving, considering and sharing information so people understand what needs to happen. It includes noticing uncertainty, asking a useful question, explaining the purpose and making room for the other person to respond.

You bring ways of communicating from your experiences, relationships, languages and responsibilities. Other learners bring their own. This classroom does not treat one accent, speaking pace, eye-contact pattern or way of sitting as proof of respect or competence. We will look for understanding and useful interaction. You may use speech, sign, augmentative and alternative communication, text or another agreed accessible mode. Identify the mode and support in the learning record.

In B.C., a training group may include First Nations, Métis and Inuit learners from different places, including people whose Nations are outside the province. No one person can explain how every Indigenous person communicates. Ask about the needs of this conversation and this person. You can share an experience if you choose; you can also use the fictional cases throughout. Personal stories, cultural knowledge and identity explanations are not required contributions.

All cases, people, times and arrangements are invented classroom examples. The asphalt content introduces equipment purposes, not live operating procedures. Practise with a clear purpose and opportunities to pause, receive feedback and try again.

Six connected components

The component names below come from page 85 of the supplied SkillPlan guide. Use appropriate communication modes to demonstrate each purpose.

Component	What you practise	Main evidence
1. Listen with intention	Prepare to receive the message and attend to its purpose.	CM-01–CM-03
2. Listen to understand	Paraphrase, distinguish facts from assumptions and clarify.	CM-04–CM-06
3. Speak with clarity	Organize the message and use words the recipient can understand.	CM-07–CM-09
4. Speak with purpose	Make the reason, request or next step clear.	CM-10–CM-12
5. Adapt to your audience and contexts	Consider what this audience knows and needs without stereotyping.	CM-13–CM-15

Component	What you practise	Main evidence
6. Adapt to other people's different communication modes and tools	Agree a usable channel, pace and check-back method.	CM-16–CM-18

A shared product does not show every person's communication. Each learner needs turns sending and receiving a message. A written summary may help, but do not use its spelling or length as the only evidence of listening. The instructor can observe a paraphrase, a selected response, an appropriate action in the simulation or a clarification exchange. Recording is optional and requires agreement; live observation also provides evidence.

Listen with a reason

Listening with intention begins before the words arrive. Ask what you need to learn from the message. Are you receiving a change in location, hearing a concern, comparing a proposal or deciding what question to ask next? Knowing the purpose helps you identify the important details. It also helps you avoid preparing your own reply while the other person is still explaining the issue.

Check the setting. Background noise, overlapping talk, small text, an unfamiliar term or a weak connection can interrupt understanding. You can ask to move to a quieter classroom position, receive a written key point, use captions, slow the pace or repeat a section. These are communication strategies. They are not admissions that you are incapable of learning. The speaker also shares responsibility for making the message usable.

Attention can be shown in different ways. A person may look at a diagram, use a communication device, take notes, pause before responding or look away while processing. Do not infer attention from eye contact alone. Check understanding through the response. A useful phrase is “I want to make sure I have the change right. Could we go through the time and location once more?”

Case document A • A classroom change that needs to reach everyone

> **Fictional coordinator message**
>
> “For Thursday's classroom session, meet in **Room 2 at 10:00**, instead of Room 1. The session ends at **10:45**. Bring your learner workbook and a pen. The equipment-card activity stays indoors; we are not visiting a worksite. Printed copies of the process map will be available in Room 2. If the room change creates an access issue, tell the instructor through the usual course contact so an arrangement can be discussed. You do not need to explain private details to the whole group.”
>
> **Context for the sender:** Some learners may have seen an earlier notice showing Room 1. Your immediate purpose is to communicate the current classroom arrangement. You have not been given information about bus departures, parking, meal arrangements or attendance consequences. Do not invent those details when a listener asks.

For an activity focused on receiving a message, the instructor may read the message or provide it in the receiver's agreed accessible mode. A receiver who has already studied the printed version should say so; the instructor can use a different comparable message for a later listening observation. Reading the script is useful preparation, but it is different evidence from understanding a newly received message.

CM-01 • Identify what you need to listen for

Before receiving Case A, identify three kinds of information you would need to carry out its purpose. Then receive the message in your agreed mode and identify the actual purpose. Separate the details supplied from questions you still have. A short spoken response, a few selected labels or a diagram can show your understanding; an extended written paragraph is unnecessary for this listening task.

CM-02 • Prepare a usable conversation

With a partner, identify one possible classroom barrier to receiving Case A and agree one adjustment. For example, take turns without overlapping, provide a clear view of the relevant text, reduce background noise or allow time for a communication device. Practise asking for the adjustment respectfully. State what you will use to check understanding afterward. Do not simulate a disability or assign one to your partner.

CM-03 • Show attention through a useful response

Partner A sends the Case A message in the agreed mode. Partner B receives it, then identifies the main change and asks whether one chosen detail was understood correctly. Swap roles using this second message: “Tomorrow's practice discussion starts at 13:00 in the same classroom. Bring the revised card record. The instructor will provide printed copies for anyone who needs one.” Observe the response, not whether the listener copied a particular posture or expression.

Listen to understand, then check

Understanding means more than remembering isolated words. Connect the details to the speaker's purpose. In Case A, the room change matters because someone following the earlier notice could go to the wrong place. The statement that the activity stays indoors limits what the listener should assume about equipment or travel. The access-contact instruction offers a private route without promising a particular adjustment before it is discussed.

Paraphrasing means expressing the message in your own words while keeping its meaning. It is not adding what you think the speaker should have said. A useful check-back is short enough for the sender to confirm or correct. You can then ask about an unresolved detail. Confirmation is a two-way action: the sender needs to notice whether the paraphrase is accurate, not simply say “yes” to finish the conversation.

Questions can clarify meaning, detail or action. “Which room?” asks for a missing detail. “When you say ‘revised record,’ do you mean version 2?” checks a term. “Should I wait for confirmation before sharing this change?” asks about a next step. Choose the question that would change what you do. Asking ten unrelated questions can make an important uncertainty harder to see.

Worked example 1 • Paraphrase without expanding the promise

A careful listener says: “Thursday's indoor card activity is now in Room 2, from 10:00 to 10:45. I should bring the workbook and a pen, and printed maps will be there. Have I got that right?” The sender checks those details and confirms them. The listener then asks: “Which course contact should someone use to discuss an access issue?” The case says the usual contact, but does not name it, so the sender should identify the approved classroom contact or ask the instructor to confirm it.

An inaccurate paraphrase would be: “Everyone has to arrive early, all access arrangements are already approved, and there will be a bus.” Those claims were not in the message. Good intentions do not make them reliable. Keep a clear boundary between the message received, a reasonable question and an answer that still needs confirmation.

CM-04 • Paraphrase and confirm

Receive Case A or an instructor-provided comparable message. Give a concise paraphrase that preserves the purpose and at least four relevant details. Invite correction. The sender identifies anything changed or missing, and you revise your paraphrase. Record one correction if needed. If the first paraphrase is accurate, explain how the sender checked it against the message rather than merely agreeing politely.

CM-05 • Ask the question that matters

A fictional learner asks, “Will transportation be provided?” The message does not say. Practise a response that distinguishes known information from an unanswered question and identifies who should confirm it. Then ask two useful clarification questions about Case A: one about a practical detail and one about the next action. Avoid a question that asks another learner to disclose a private reason for needing an arrangement.

CM-06 • Resolve a contradictory message

You hear a partner say, “The class is still in Room 1 and goes until 11:00.” Use Case A to check the discrepancy. Respond without labelling the partner careless or dishonest. State the conflicting details, identify the current source you are using, and ask to verify together. End with an agreed message or an explicit unresolved question for the instructor. Do not leave the exchange with two conflicting versions silently circulating.

Speak with clarity: organize before you deliver

A clear message gives the listener a route through the information. Start with the main point, then the details needed to understand or act. Use short groups of related ideas. Explain an unfamiliar word when it first matters. A pause can make room for processing, a question or an accessible response; it does not have to be filled with more information.

Plain language preserves accuracy. “The screed helps control the thickness of the layer being placed” is clearer for a new learner than unexplained specialist language. It does not mean the speaker should invent a simplified operating rule. If the recipient needs technical detail beyond your knowledge or role, identify that boundary and refer the question to the qualified instructor.

Check reference words such as “it,” “that” and “over there.” They may be clear to someone standing beside you and unclear to a person on a phone or using a text version. Name the item or location. If a sequence matters, use numbered steps or clear transition words. Avoid packing a change, an exception and a new request into one long sentence.

Case document B • Two people understood different tasks

Fictional pair activity

The task sheet says: “Arrange five stage labels in process order. Add one short purpose under each. Both partners explain one connection. Keep the equipment cards beside the map so you can check terminology.”

One partner arranges the stage labels. The other begins sorting the six equipment cards into a separate row. The first says, “You are doing the wrong thing.” The second replies, “I thought you wanted all the cards put in order. You did not say which cards.” Both want to finish the activity, but neither has checked the shared instruction aloud.

The stage labels are **pit or quarry, plant, haul, place and compact**. The equipment cards describe different pieces of equipment or components; there are six cards, so they are not a second identical five-stage sequence. The task is an introductory classroom explanation, not an equipment operating sequence.

Use these six introductory equipment-purpose cards for the role-play. Copy the rows onto separate cards if helpful.

Card	Purpose
E1 · Screed	Helps control the thickness of the asphalt layer being placed.
E2 · Crusher or screening plant	A crusher reduces material size; a screen separates material by size.
E3 · Asphalt plant	Prepares the specified asphalt mixture.
E4 · Haul truck	Moves paving material between the supply point and work area.
E5 · Asphalt paver	Receives mixture and moves it toward the screed during placement.
E6 · Compaction roller	Compacts the placed material.

The immediate communication problem is a different interpretation of the task. A useful response names the shared goal and checks the document: “I think we have understood ‘cards’ differently. The sheet asks us to order the five stage labels and use the equipment cards to check terms. Can we read that line together?” This gives both people a way to revise their understanding without deciding whose personality caused the mismatch.

CM-07 • Explain a term for a new learner

Choose **aggregate**, **haul**, **paver** or **compact**. Use these introductory meanings: aggregate is mineral material such as sand, gravel or crushed stone; haul means move material between places; a paver places asphalt mixture as part of the paving process; compact means make the placed material denser through the appropriate technical process. Give a short explanation in ordinary language and one classroom example. Invite a question. Do not add operating settings or safety distances.

CM-08 • Give a clear three-step instruction

Use Case B to make a three-step instruction for the pair activity. Identify the correct cards, the expected result and each person's contribution. Send it to a partner who has not arranged the map yet. Ask them to restate the steps before carrying them out. Improve a phrase that could be misunderstood. If both people already know the task, change the card order or use another supplied classroom task for a fresh check.

CM-09 • Repair the unclear reference

Rewrite this message for someone receiving it by phone: “Put those there, use the other ones to check it, and then tell them what it means.” Supply the intended names from Case B and make the recipient and purpose clear. Deliver your revised message in the agreed mode, then ask the listener what they would do. Notice whether your words alone provide enough information without pointing at objects the listener cannot see.

Speak with purpose: what does the listener need to do?

Messages can inform, request, explain, propose, confirm or raise a concern. More than one purpose may appear in a conversation, but the main purpose should be easy to identify. “I am letting you know” differs from “I need your decision.” A listener should not have to guess whether you want action, agreement or simply awareness.

For a request, name what you need, why it matters and when a response would be useful. Avoid promising authority you do not have. “Could the coordinator confirm which version we should use?” is different from “I have approved this version.” For a handover, say what is completed, what remains uncertain and who is taking the next step. This protects continuity when people work at different times or through different channels.

Tone matters, but it does not replace the facts. A calm message can still be unclear, and a person under pressure may have an important concern even if their delivery is uneven. Focus first on understanding the issue and agreed next action. You can ask to pause, involve the instructor or use another channel if the exchange becomes unproductive. Classroom practice should not require reenacting a personal conflict.

Worked example 2 • Turn a vague complaint into a useful request

Vague message: “The files are a mess, and nobody can do this.” The listener may not know which files, what task is blocked or what help is needed. A clearer practice request is: “I am preparing the card-count handout. I found two files labelled version 2 with different totals. Could you confirm the approved file before I print? I have paused the print step and can show both records.”

The revised message gives context, observed problem, requested action and current status. It does not assign blame or guess which file is correct. If the recipient cannot approve the file, the next question is who has that responsibility. The message remains useful even when the answer is “I need to check.”

CM-10 • Match purpose and wording

For each situation, name the main purpose and draft a two-sentence message: tell a partner the room has changed; ask the instructor to confirm a file version; propose a clearer heading for a visitor sheet. Include the response needed, if any. Compare the messages and explain why the same wording would not suit all three. A request should not be disguised as a statement that the decision has already been made.

CM-11 • Practise a short clarification call

In a role-play, one learner calls the fictional training office to ask whether the card activity is indoors and which room is current. The office role has Case A and may answer only from that information. Open with purpose, ask the questions, listen to the answers and check back the key details. Close by identifying any remaining question. Swap roles. No real phone call is required; do not invent transportation, eligibility or attendance rules.

CM-12 • Give a useful handover

Use this invented status: the material-flow cards are printed; the equipment-purpose cards are checked but not printed; the room sign still shows the old location; the instructor needs to confirm who can replace the sign. Give the next learner a handover that separates completed work, remaining work and the decision needing confirmation. Ask them to identify their understood next step. A clear handover should not quietly authorize them to alter a real sign or room arrangement.

Adapt to the audience without making assumptions about them

Audience awareness begins with purpose and relevant knowledge. A new learner may need a term explained. An instructor reviewing the same work may need the evidence and the unresolved question. A visitor may need a short overview and a route to further information. Ask what the person needs rather than assuming it from appearance, age, identity or a guess about their background.

Intercultural communication includes noticing your own interpretations. A pause might mean someone is considering the question, using a communication tool, waiting for their turn, unsure of a term or choosing not to answer. A brief reply might be enough for that task. Describe what happened before explaining what you think it means. Then seek clarification in a way that allows the other person to choose what to share.

A person's cultural knowledge is not a classroom resource automatically available on request. If a project needs a specific community perspective, the instructor or coordinator should arrange an appropriate relationship and permission process with the relevant people. A learner may volunteer a perspective, but that contribution should not be treated as representing an entire Nation or giving permission for public use. For this chapter, the fictional cases provide all the content needed for practice.

Case document C • One message, different access needs

Fictional open-classroom planning note

The group will explain its introductory paving process map to visitors. Some visitors are new to trade vocabulary. One visitor asks for key points in writing before the discussion. Another asks the speaker to face the group and avoid talking over other people so the conversation is easier to follow. A third will join through an online connection and wants the diagram described rather than referred to as “this bit here.”

No visitor has asked learners to guess a medical condition or cultural preference. The group can respond to the stated communication needs. The planned message is: mineral materials can come from pits or quarries; an asphalt plant prepares the specified mixture; hauling moves it to the work area; a paver places it; compaction follows as part of the technical process. The display is introductory learning, not operating guidance.

The coordinator asks the group to keep the explanation to about one minute, leave time for a question and offer a clear next contact for detailed technical questions. The classroom instructor is the appropriate first contact for this exercise. The group may use a written key-point card, the labelled diagram and a spoken or otherwise accessible explanation.

Worked example 3 • Change the delivery, preserve the meaning

For a new visitor, begin: “This map shows five broad stages in a basic paving example. We start with mineral materials, then prepare and move the mixture, place it and compact it.” Point to or describe the numbered stages, explain one unfamiliar word and invite a question. For the instructor, a useful version might begin: “Our map uses five introductory stages. We checked the equipment-purpose wording against the lesson sheet and kept operating settings out of the display.” The core information remains consistent, while the purpose and detail change.

For a remote listener, replace “look at the red box” with “stage three, labelled Haul, means moving the mixture to the work area.” Colour can support the visual but should not carry the only meaning. For someone using a written key-point card, allow time to read and ask whether the sequence is clear. Do not mistake a different response pace for a lack of interest.

CM-13 • Make two audience versions

Prepare a short explanation of the same five-stage map for a new learner and for an instructor reviewing accuracy. Identify the purpose of each version and what knowledge you are assuming. Deliver both versions to a partner taking the relevant role. Ask what was clear and what needed explanation. Revise one feature while keeping the technical meaning and limits consistent.

CM-14 • Separate observation from interpretation

Consider this fictional exchange: a learner pauses for several seconds after a question and looks at the printed map. Someone says, “They are not interested.” State what was actually observed, give three possible interpretations and suggest a respectful clarification. Choose a response that allows time or another mode without diagnosing the person. Explain why a single behaviour cannot establish someone's attitude or a rule about their culture.

CM-15 • Ask about the conversation, not a stereotype

Revise these questions: “People from your community always prefer stories, right?” and “Why won't you look at me when I speak?” Make them relevant to the present task, with room for choice. Then practise asking a partner which information and communication format would help them review the process map. The partner may answer briefly or choose the supplied Case C preferences. No one has to describe their community or personal history.

Adapt the mode and keep the interaction two-way

A communication mode is a way of exchanging meaning, such as speech, sign, text, symbols or an augmentative communication system. A tool supports that exchange, such as a phone, caption display, shared document or communication device. Ask which mode and tool work for the task and the people involved. Do not assume that access to a tool guarantees that a conversation is accessible.

Allow response time. Speak or present one meaningful section at a time, then make space for a reply. In a text exchange, make the question and requested response visible. In a meeting, identify the speaker and avoid several people speaking at once. If captions or a connection fail, pause and agree a way to continue rather than pretending everyone received the missing information.

Check the message after a change of mode. A phone explanation may need a written reference number; a diagram may need a description; a written update may need a short interaction to resolve ambiguity. Keep only the record needed for the task. Do not record, photograph or circulate another person's contribution without the agreed purpose and permission. A live demonstration can be assessed without storing personal audio or video.

CM-16 • Practise an agreed accessible exchange

Work with a partner using modes each person chooses. One person requests the current room and start time; the other answers from Case A. Agree how each will signal a turn, request repetition and confirm understanding. Demonstrate the exchange, then swap roles. You may use written messages, speech, AAC or another available mode; do not imitate another person's disability. The observer records whether both people could send, receive and clarify the actual message.

CM-17 • Recover a missing part of the message

Simulate a connection interruption by having the sender deliberately omit the room number from this practice message: “The session begins at 10:00 in … and ends at 10:45.” The receiver identifies the missing information and requests it through an agreed alternate route. The sender supplies Room 2 and checks the complete message. Explain how you would distinguish a successful technical connection from actual understanding of the content.

CM-18 • Complete a changed-mode handover

Begin with the CM-12 handover as a face-to-face or agreed live exchange. The instructor then changes the task: the next learner must receive it through a short written or otherwise accessible remote message, followed by a question-and-response check. Adapt the message, preserve completed/pending/confirmation-needed distinctions and test it. Record one change that helped the recipient. Identify a new work or learning situation where the same strategy might help, without claiming that future transfer has already occurred.

Reflect on evidence, not personality

Keep an example of a paraphrase, a useful clarification, a plain-language explanation, a purpose-focused request and an adapted message. An observer's note should describe what happened: “Asked which version was current and repeated the confirmed room/time.” Avoid labels such as “good attitude,” “natural speaker” or “poor communicator.” Those labels obscure the next practice step.

For supported practice, use a short script, a visual checklist, a private instructor partnership or more response time. For extension, change the audience or introduce one missing detail while preserving a clear purpose. Give specific feedback and repeat the interaction. The local descriptions **Not observed**, **Not yet demonstrated**, **Demonstrated with support** and **Demonstrated independently** describe evidence under stated conditions; they are not official Communication proficiency scores.

Teaching-source connection: SkillPlan, *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp.85–91: six Communication components, intercultural interpretation, explicit listening instruction, repeated simulations and assessment that does not confuse listening with extended writing. The cases and prose are original ACCESS IS4S adaptations. Equipment-card purposes are supported by the supplied asphalt outline, PDF pp.39–41, 75, 84, 87 and 95, as mapped in the asphalt A1 instructor guide. This chapter deliberately uses understanding and accessible interaction as evidence rather than treating eye contact, stillness, accent or voluntary personal disclosure as universal standards.

Collaboration — contribute, listen and finish together

Your contribution belongs in the work

Collaboration means contributing and supporting other people toward a shared goal. You may already do this when arranging a ride, working alongside a crew, helping organize an activity or making decisions with people you trust. This chapter gives you language and practice for making that work clearer. It also gives you ways to notice whether everyone has a useful opportunity to contribute.

Working together does not mean everyone must speak in the same way, agree immediately or complete identical tasks. A strong team can include someone who likes to speak while thinking, someone who wants time to read, someone using an assistive tool and someone learning unfamiliar trade vocabulary. The goal is to make those contributions available to the team without deciding in advance what any person can do.

In an ACCESS IS4S classroom, learners may have connections with different First Nations, Métis or Inuit communities, may live away from their home community, or may choose not to discuss those connections. You decide what personal knowledge you share. No classmate is the spokesperson for an entire people. The cases here are fictional classroom situations; they do not describe a Nation's decision-making practices.

You will practise six connected parts of collaboration. The component names below come from the supplied SkillPlan guide. The activities, cases and evidence descriptions are original learning materials.

Component	What you will practise	Main evidence
1. Work well with other people	Make clear agreements, take a role and keep others informed.	CL-01–CL-03, CL-10
2. Value diversity and inclusivity of others	Ask about useful participation options and use different contributions.	CL-04–CL-06
3. Manage difficult interactions with other people	Address a disagreement using the task, evidence and a suitable next step.	CL-07–CL-09
4. Facilitate an environment where you can collaborate with others	Make it easier to contribute, ask questions and receive feedback.	CL-04, CL-12, CL-16
5. Achieve a common goal with others	Coordinate contributions and check the shared result.	CL-10–CL-15
6. Reflect and improve on how well the team works together	Use observations to choose and try a better team practice.	CL-15–CL-18

Case document 1 · The visitor information pack

Fictional practice brief — Willow Reach training room, version 1. Four learners are preparing an information pack for six visitors who want to understand introductory asphalt training. The visitors will use the pack in a classroom; it will not authorize anyone to enter a worksite or operate equipment. The pack must include a five-stage process card, a short explanation of road-owner and contractor roles, and a clear session schedule.

The process card must use this order: pit or quarry → plant → haul → place → compact. It must say that real projects include additional preparation, checking and finishing. The project example names the fictional Town of Willow Reach as the road owner and fictional Pathway Paving Company as the contractor. Those are assigned roles in a practice document, not a rule about every B.C. project.

The visitor session starts at 10:00. Welcome and orientation take 10 minutes. The equipment-purpose activity runs from 10:10 to 10:30. Questions run from 10:30 to 10:45. There are six visitors, but a visitor may prefer a large-print copy or a spoken explanation. The coordinator has asked the team to check those preferences before deciding how many copies to produce. No visitor needs to give a reason for a format request.

The team has 45 classroom minutes to prepare a draft. It can use paper, a shared computer or both. One person may coordinate the work, another check source facts, another arrange the draft and another test whether a reader can find the information. These are temporary roles. They may be shared or changed by agreement; the person at the keyboard does not automatically become the decision-maker.

Before work begins, the coordinator asks for one group agreement and one way each member will contribute. At the end, the coordinator will inspect both the pack and how the team worked. A polished pack does not show who had the chance to participate.

CL-01 · Find the shared goal

Read the brief individually, then explain the goal to a partner without listing every instruction. Together, write one sentence beginning, “We will know the pack is ready when…” Include the three required parts and a reader check. Mark two things the brief does **not** authorize. Compare your goal sentence with the brief and identify the wording you used.

CL-02 · Agree how to begin

In a team of two to four, propose three working agreements that would help this task. Make each agreement observable: “We ask before replacing another person's wording” is clearer than “Be respectful.” Discuss how someone can request thinking time, a different communication mode or help. Keep a short record of one agreement suggested by each member and the final wording the team chose.

CL-03 · Take a role, then hand it over

Choose temporary roles for the first part of the pack. State your responsibility, the information you need and what you will pass to the next person. After a short first attempt, rotate at least one role. Give a handover that explains what is finished, what is uncertain and what needs checking. The receiving person restates the handover before continuing.

Make room for different ways to contribute

A team can look busy while excluding useful knowledge. If one person controls the document, sets every deadline and answers every question, other members may have little influence even when they are present. Inclusion requires a practical change to the process: shared access to the source, a chance to think, an invitation to contribute, and a way to see how a suggestion affected the result.

Ask what would help the task rather than demanding an explanation of a person's needs. “Would a printed copy or a spoken review work better?” offers a choice. “Why can't you read it on the screen?” asks the person to defend themselves. A choice should be genuine. If the team offers a spoken review, it must leave time for that review instead of treating it as an inconvenience.

Different experience can improve a draft. Someone familiar with community events may notice that a schedule needs a clear end time. Someone who has worked around equipment may recognize a confusing term. Someone new to the subject may reveal what a visitor will not understand. Prior knowledge is useful, but everyone still checks the supplied facts. Confidence, age, accent or speed is not a substitute for evidence.

An invitation also includes the option to pass. A learner can contribute through source checking, a written note, a diagram, an accessible communication tool or a later turn. Passing on a personal question is not refusal to learn. If an assigned task prevents meaningful participation, the team and instructor can adjust the task while keeping the intended skill visible.

Worked example 1 — change the invitation. A coordinator says, “You have not said anything, so you can just staple the copies.” This assigns a role without finding out what the person can contribute. A more useful approach is: “We need to check whether the schedule is clear. Would you like to review a printed copy, talk it through with me, or take another part?” The learner chooses a printed review and finds that the question period has no end time. The team adds 10:45 and records the contribution. Inclusion changed the work; it was not just a friendly greeting.

CL-04 · Repair an excluding process

A fictional team shares one small screen. Two people make changes while a third person cannot see the text. The third person asks for a copy and is told, “We are nearly done.” Identify the process problem without guessing anyone's intentions. Propose two workable adjustments, choose one, and explain how the team will know the third person had a meaningful opportunity to contribute.

CL-05 · Use two perspectives

Ask one partner to read the visitor schedule as the person preparing the session and another to read it as a first-time visitor. Use only the fictional brief; no one needs to share personal travel or accessibility information. Record one question from each perspective. Decide whether the existing document answers each question, needs clarification or leaves a decision to the coordinator.

CL-06 · Invite knowledge without claiming it

A teammate suggests adding a local teaching or image they saw online to make the pack “more Indigenous.” Draft a response that values the intention but does not assume permission, ownership or relevance. Offer a useful contribution the team can make immediately using the supplied learning material. Identify who should guide any later addition of specific community knowledge or imagery.

Case document 2 · A disagreement about the draft

Fictional team record. At the halfway point, Morgan has written, “A roller places asphalt.” Sam points to the process card and says the paver places the mixture while rollers compact it. Morgan replies, “I have already finished that section.” The team has not yet decided how corrections are approved. Robin notices the disagreement but is checking the schedule. Alex is using the computer and has not changed the sentence.

The available evidence is short and specific: the supplied process description says a truck transports the mixture, a paver places it and rollers compact it. The group is not being asked to decide operating settings or whether anyone has enough workplace experience. It needs an accurate introductory sentence.

A second issue concerns layout. Morgan prefers a large flow diagram; Sam prefers three question-and-answer boxes. Both layouts could meet the brief. No reader has tested either one. A factual correction and a design preference are different kinds of disagreement. The first can be checked against the supplied source. The second needs criteria and a simple reader test.

The coordinator is available for clarification. If a conversation becomes personal, threatening or discriminatory, learners can stop the interaction and seek instructor support. They are not required to negotiate their way through harmful behaviour as a demonstration of collaboration. For an ordinary task disagreement, the team can slow down, identify the issue and work toward a clear decision.

Disagree about the work without reducing the person

Use a short sequence: **describe the issue → hear each view → check the task or evidence → agree a next action → confirm the decision**. Each step protects information that can otherwise get lost. Describing the issue keeps the conversation specific. Hearing each view checks whether people are discussing the same question. Evidence and criteria give the group something more reliable than status or volume.

A useful statement names an observable detail: “Our sentence says the roller places the mixture, but the source gives placement to the paver.” It does not claim, “You never listen.” The first statement can be checked and corrected. The second makes a judgement about the person and invites a different argument. You can be clear about an error without weakening the relationship.

Agreement does not require pretending that every idea was equally useful. A team may reject a proposal because it does not fit the brief. The person who proposed it can still be heard and credited. Record the reason: “We chose the question layout because two readers found the owner information faster,” rather than “The other layout was bad.” Where evidence is incomplete, write down the uncertainty and who will check it.

Worked example 2 — separate fact from preference. Alex pauses editing and says, “First let us settle the equipment sentence.” Sam reads the source wording. Morgan restates the correction, and Alex changes the sentence to “The paver places the mixture; rollers compact it.” The group then draws both layouts on scrap

paper. Robin tests each one using the question, “Who owns the road in this example?” The team selects a layout for a stated reason. One evidence check solved the factual issue; a different process addressed the design choice.

CL-07 · Sort the disagreement

For each issue in Case document 2, identify whether it concerns a source fact, a design preference or the team's working process. Write the question that would help resolve it and the evidence or agreement needed. Explain why voting on the equipment fact would be weaker than checking the supplied source, even if most people voted for the same answer.

CL-08 · Practise a useful disagreement

With a partner, use the layout disagreement from the case. Each person explains a reason for a layout; the listener restates it before responding. Use the five-step sequence and finish with a next action rather than a forced winner. Swap roles. An observer or instructor records one exact phrase that helped clarify the issue and one point the pair could improve.

CL-09 · Choose the right support

Consider three situations: a teammate wants a different heading; the source documents appear to conflict; a teammate makes a personal or discriminatory remark. For each, propose an appropriate next step and explain why. Include when to continue a task discussion, when to ask the coordinator for source clarification and when to stop and seek support. Do not invent a workplace reporting policy.

Turn individual tasks into one finished result

Shared work needs visible connections. A list of names beside tasks is only a beginning. The team also needs to know what each task produces, who needs that output, how it will be checked and what happens if it is delayed. A handover can be a brief spoken exchange, a labelled paper or a note in a shared document. Its purpose is to prevent someone from guessing whether unfinished work is ready.

A practical task board has four columns: **task, person or pair, handover, check**. The person named is responsible for making the status clear, not necessarily for doing every step alone. Asking for help early can protect the shared goal. Quietly working past a deadline while others wait makes coordination harder, even when the person is trying very hard.

Check both the product and the process. Product checks ask whether the three required sections are accurate and understandable. Process checks ask whether contributions were invited, information was shared and disagreements were handled using the agreed method. A team can produce an accurate pack while relying unfairly on one person. It can also collaborate thoughtfully and still need instruction to correct an equipment term. Those findings require different feedback.

Worked example 3 — a useful handover. “The schedule is done” leaves several questions unanswered. A clearer handover is: “The times match the brief, including the 10:45 finish. I have marked the visitor-format question as pending. Please check the font and ask the coordinator about copy formats before printing.” The

receiver replies, “I will keep the times, check readability and confirm formats; I will not treat the pending question as settled.” The team has transferred both completed work and uncertainty.

CL-10 · Build a task board

Create a four-column board for the three parts of the visitor pack and its final reader check. Use real team members or fictional role names. Include a handover and a check for every task. Identify one point where another person's work depends on yours. Agree how to report a delay or unresolved question before it affects the next task.

CL-11 · Check before combining

Combine the team's three draft sections. Each person checks a section they did not create against Case document 1. Record one confirmed detail, one correction or clarification, and who will make it. If no correction is needed, explain what you checked rather than inventing an error. Each author responds to the check and confirms the final change or decision.

CL-12 · Facilitate one short meeting

Take a turn facilitating a five-minute check-in. State the purpose, invite each person's status, name any dependency and summarize the next actions. Offer a written or supported contribution route. Ask one participant whether your summary reflects their message. The observer records what the facilitator actually did to make participation possible; a confident speaking style is not the criterion.

Case document 3 · The team receives a change

Fictional coordinator update. Two of the six visitors have asked for larger print. One visitor would prefer a spoken review of the process card. The coordinator can provide a second room for the spoken review, but only from 10:10 to 10:30. The main schedule remains unchanged. The team has not been given any personal information explaining the requests, and it does not need that information to prepare the materials.

The computer is now available for only the next ten classroom minutes. Paper copies of the source brief and both draft layouts are available throughout. The team must decide what needs the computer and what can be completed on paper or through a conversation. It can ask the instructor to print a final file later, but must leave clear instructions about the versions and number of copies.

The coordinator does not want the team to promise a separate equipment demonstration. The spoken review is a classroom explanation using the same introductory information. Whoever supports it needs an accurate source card and a chance to practise the explanation. The pack should make clear which information belongs to the fictional example.

The task is still shared. The team should revise the plan, confirm the effect on each role and check that no member loses their contribution when the format changes. A good response may retain most of the first draft. Adapting together does not require discarding work that already meets the brief.

CL-13 · Replan together

Read the update separately, then each person identifies one changed requirement and one unchanged requirement. Revise the task board together. Assign the ten minutes of computer access to work that actually needs it and name at least one task that can continue without it. Confirm the new handovers. Keep the original board so the change in coordination is visible.

CL-14 · Produce and test the shared pack

Finish a practice pack using the available classroom tools. Ask another pair or the instructor to find the process order, the road owner and the question-period end time. Also ask how the larger-print and spoken-review requests will be met. Record the reader's answers and one useful change. Each team member explains their contribution without claiming work completed by someone else.

CL-15 · Compare result and interaction

Make two short evidence lists: one about the finished pack and one about how the team worked. Include at least two observations in each. Use a specific moment, document or quoted phrase. Identify one interaction that helped the product and one process improvement for next time. Avoid labelling a person “good at teamwork” without showing the action behind that judgement.

Reflect, retry and carry the skill forward

Reflection is useful when it changes the next attempt. “We should communicate better” is too broad to guide a team. “At our next check-in, the receiver will restate each handover before starting” identifies a practice the team can try and observe. Choose an improvement that is within the team's control and small enough to test during a short task.

Feedback can recognize both contribution and support. “Your source check caught the missing end time” names an action. “You are the organized one” may sound positive, but it can trap a person in the same role and leave others without practice. Share roles over time and allow people to build new strengths. Record support honestly: using a checklist or an instructor prompt is part of the learning evidence, not a reason to hide the attempt.

The local feedback descriptions in this book are **Not observed, Not yet demonstrated, Demonstrated with support,** and **Demonstrated independently**. They describe evidence from a particular task, not official proficiency levels or a person's worth. A reflection about using a skill at work is a plan for transfer; actual transfer needs another observed task or a later example with its context recorded.

CL-16 · Test one team improvement

Choose one process improvement from CL-15. Test it while making a four-line summary of the visitor pack for a new classroom partner. Use the same source facts. Before beginning, state what behaviour you will watch for. Afterwards, compare what happened with your expectation and decide whether to keep, adjust or replace the practice.

CL-17 · Transfer to another setting

Choose a fictional setting: a training-room supply handover, a community-room booking task or an office information-sheet update. Explain how the shared goal, roles, contributions and checks would change. Identify one collaboration practice you would retain and one detail you would need to ask about locally. Do not assume a classroom agreement is an actual workplace or community protocol.

CL-18 · Build your collaboration evidence note

Select evidence for all six components from this chapter. Identify an activity, what you did, support used and a next practice step. Choose one component for another attempt and write an observable goal. Ask a partner or instructor whether the evidence describes an action they could recognize. Keep the note with the task board, reader feedback and one revised product.

Choose your next practice

For a supported route, work in a pair, use a partly completed task board and rehearse a handover with the instructor. Focus on two observable actions at a time, such as inviting a contribution and confirming a decision. The goal is a meaningful contribution with appropriate support, not rapid completion of every activity.

For an extension, work with a new partner and a different supplied document. Agree the process before beginning, then compare what transferred and what needed adjustment. More people or less time do not automatically make a better assessment. The task must still allow each learner to contribute and the observer to collect useful evidence.

Source and design note. The six component names are reproduced from SkillPlan's March 2024 guide, p.92. Relationship-centred instruction, explicit teaching and structured roles inform this chapter (pp.93–95); assessment of interaction separately from group products informs the evidence tasks (p.96). The cases and learning activities are original ACCESS IS4S adaptations. They do not claim community endorsement, current regulatory authority or official proficiency assessment.

Adaptability — keep the purpose, adjust the plan

Change the approach with care

Adaptability is the ability to work toward or adjust a goal when circumstances change. It includes noticing what has changed, deciding what still matters, choosing a workable response and learning from the attempt. Sometimes the response is a new method. Sometimes it is a request for support, a revised deadline or a decision to pause until the right information is available.

You may already adapt while balancing training, employment, travel, family responsibilities or community commitments. This chapter does not ask you to disclose those responsibilities. It uses fictional situations so you can practise without putting private information on a worksheet. You can choose a different relevant example with the instructor, provided the same skill can be observed.

Training in B.C. may take place close to home or away from people and places that support you. Your own priorities belong in goal setting when you want them included. You might connect a learning goal with employment, a community role, further study or a practical task that matters to you. The instructor can help make the plan workable without asking you to justify your identity or disclose private commitments.

Being adaptable does not mean accepting every request, hiding frustration or continuing through an unsafe situation. It does not make an individual responsible for barriers outside their control. A useful plan identifies both your next action and any support or decision another person must provide. Asking for an accessible format, clarification or an appropriate adjustment can be part of responsible action.

The six component names below are from the supplied SkillPlan guide. In this chapter, emotional regulation means choosing a practical way to respond or regain focus when that is useful. It is not a test of whether your feelings are acceptable. The instructor observes the plan and actions you choose, not a diagnosis, a personality trait or a requirement to appear cheerful.

Component	What you will practise	Main evidence
1. Demonstrate responsibility	Clarify commitments, attend to the task and report relevant changes.	AD-01–AD-03
2. Persist and persevere	Try a purposeful next step, use support and recognize when the approach needs changing.	AD-07–AD-09
3. Regulate your emotions when appropriate	Choose a task-focused pause or support strategy without required personal disclosure.	AD-04–AD-06
4. Set or adjust your goals and expectations	Define a meaningful goal and revise it when resources change.	AD-02, AD-10–AD-12

Component	What you will practise	Main evidence
5. Plan and prioritize	Identify dependencies, choose an order and make space for checking.	AD-03, AD-10–AD-15
6. Seek self-improvement	Use specific feedback, compare attempts and choose further practice.	AD-13–AD-18

Case document 1 · A plan for the learning folder

Fictional ACCESS-style classroom schedule. A learner is preparing a small learning folder to show three kinds of work: a checked industry table, a short project note and a reflection explaining one improvement. The table uses invented data from the introductory asphalt unit. The project note must distinguish the fictional road owner from the contractor and label the numbers as practice data. The reflection should name a change the learner made after feedback.

The initial goal is to complete the folder by Friday at 12:00. Two supported classroom work periods are available: Tuesday for 60 minutes and Thursday for 90 minutes. These times are classroom planning values, not a requirement of a funded program or a real person's schedule. An instructor can help the learner identify a smaller starting point or an accessible response method.

The learner's Tuesday plan is to read the brief for 20 minutes, practise the table calculation for 25 minutes and check the result for 15 minutes. Thursday's plan is to use the digital tool for 35 minutes, draft the project note for 25 minutes, review the folder for 15 minutes and keep 15 minutes available for questions or revision. The digital task includes entering and checking data, saving a file and finding it again; a paper table alone does not demonstrate those actions.

The folder is a learning record, not a pass-or-fail judgement about the learner's future. A useful record shows what was attempted, what support was used and what still needs practice. If a requirement or resource changes, the learner and instructor will agree the next step. The learner should not silently remove an outcome or claim an unfinished action is complete just to meet the original date.

AD-01 · Separate the purpose from the schedule

Read the case and identify the purpose of the folder, its three products and the initial deadline. Then identify one resource and one support. Explain the difference between “complete the folder” and “demonstrate every skill independently.” Mark one outcome that cannot be demonstrated solely through paper work. Use the case rather than guessing how an actual ACCESS program assesses learners.

AD-02 · Write a goal you can check

Write a goal for one folder product that names the action, evidence and agreed time. Keep it within the resources in the case. For example, “By the end of Tuesday I will have a checked table with units and one recorded check” is more usable than “I will improve my maths.” Add the support you may use and one question to clarify with the instructor.

AD-03 · Build a first plan

Turn the Tuesday and Thursday tasks into a simple plan with time, task, output and check. Confirm that Tuesday totals 60 minutes and Thursday totals 90 minutes. Identify one dependency, such as checking source values before using them in a note. Mark the purpose of Thursday's 15-minute buffer. Explain why a buffer is not evidence that someone is working too slowly.

Stay with the task without judging yourself

When a task changes, your first response may be concern, irritation, curiosity, relief or something else. You do not have to report that response to the class. The useful learning question is, “What action will help me understand the situation and choose a next step?” A strategy can be small: reread the changed instruction, ask for one point at a time, use a written checklist, request a brief pause or speak privately with the instructor.

The strategy should fit you and the setting. A quiet pause is useful for some people and uncomfortable for others. A movement break may be possible in one classroom and require a different arrangement in another. No learner needs to close their eyes, follow a breathing exercise, discuss trauma or participate in a cultural practice to demonstrate adaptability. Choose a task-focused action that supports your work and respects the available setting.

Responsibility also includes communication. If you need a pause, a short message can protect the shared task without giving private reasons: “I need five minutes to review the changed brief. I will come back with one question.” If you cannot make a commitment, state what you can confirm and when you can update the person. Honest uncertainty is more useful than an assurance you cannot keep.

Worked example 1 — pause, clarify, choose. A learner hears, “You have less computer time now,” and starts deleting planned steps. The instructor offers the change in writing. The learner reads it, marks the time restriction and asks whether the completion date can be adjusted. The learner then chooses a revised sequence. The evidence is the clarification, revised plan and next action. The instructor does not need to decide whether the learner looked calm enough or had the “right attitude.”

AD-04 · Compare useful responses

A fictional learner receives a changed task and says, “I will finish everything somehow,” without checking the new conditions. Compare that response with “Let me identify what changed, check the required outcomes and agree what is possible.” Explain what information the second response could reveal. Name one situation in which pausing for clarification would protect the quality of the work.

AD-05 · Rehearse a strategy by choice

Choose one strategy: review the written brief, ask for a short pause, use a three-point checklist or request a private clarification. Rehearse it in a low-pressure role-play with the instructor or a partner. Use a fictional task change, not a personal stress story. Afterwards, describe what the strategy helped you do and one adjustment that would make it more useful.

AD-06 · Set a boundary and a next step

Draft a response to this classroom request: “We are behind, so skip checking the source and mark the table complete.” State what you can do, what you cannot honestly claim and a workable next step. Then explain how setting that boundary can support adaptability. Do not turn the exercise into a debate about whether a learner should tolerate unsafe or dishonest instructions.

Persistence means learning from the attempt

Repeating the same action is not always persistence toward the goal. If a saved file cannot be found, opening random folders again may create more confusion. A purposeful next attempt uses information from the first one: check the file name, recall the chosen location, use the application's recent-files list if available, or ask for a demonstration of the search step. The method changes while the learning goal remains visible.

A useful retry has four parts: **notice the result → identify one likely gap → choose a different action → check what happened**. A likely gap is a working explanation, not a judgement about ability. “I did not record the save location” points toward a practical action. “I am bad with computers” does not tell you what to practise next and may hide the exact step you already know.

Some barriers require another person's action. A broken device, inaccessible file or unavailable support is not solved by telling the learner to try harder. Record the barrier, preserve any completed evidence and agree another opportunity. Persistence may mean returning to the task when the necessary conditions exist. It can also mean deciding with the instructor to change the task while keeping the intended outcome.

Worked example 2 — a retry with evidence. A learner's table total is wrong. Instead of retyping the total, the learner compares the three source rows with the entries. One value was entered as 9 instead of 90. The learner corrects the entry, recalculates and checks the total against the paper working. The useful feedback is, “Comparing each row helped you locate the error.” The record should not say that effort alone guarantees the right answer; it names the strategy and the result.

AD-07 · Choose a better second attempt

Use this fictional record: “The learner entered three rows, saved the file, and later could not find it. They remember the file name but did not note the folder.” Propose two reasonable next actions and choose the one you would try first. Explain what you would check afterwards. Identify what evidence is already available and what remains unobserved.

AD-08 · Keep, change or ask

Sort these responses into a useful next action, an action needing revision or a request for support: repeat an unchanged calculation without checking its inputs; compare each source row with the entry; ask for an accessible copy of a file that cannot be read; claim a partner's saved file as your own; ask the instructor to demonstrate one unfamiliar saving step. Explain each choice using the learning goal.

AD-09 · Make a retry record

Choose a small classroom task you can safely repeat, such as locating a saved practice file, checking a fictional total or explaining a process term. Record the first result, the specific change in method and the second result. You may use a supplied example if you prefer. Identify the support used and what you still need to practise; do not invent a successful result if the retry remains unfinished.

Case document 2 · The time and device access change

Fictional update after Tuesday's work. Tuesday's reading, calculation practice and check are complete. Thursday's work period has been reduced from 90 minutes to 60 minutes. A device is available only during the final 25 minutes of that period. The paper brief and table remain available for the full hour. The initial digital practice was planned for 35 minutes, and the instructor does not expect the learner simply to perform it faster.

The instructor offers a supported 10-minute device appointment on Monday, followed by a separate five-minute paper-review period to update the reflection. Both periods finish before Monday at 12:00. If the learner books this arrangement, the instructor agrees that the remaining digital evidence and reflection update can be added by that deadline. The project note and an interim reflection can still be reviewed on Friday. The learner may instead propose another arrangement, but it must be confirmed; the offer does not mean every possible new deadline is approved.

The folder must continue to distinguish completed work from pending work. The project note should use the already checked paper numbers, so it can be drafted before the Thursday device turn. A paper plan can prepare the headings and file name, but it does not count as the learner using the digital tool. The reflection can explain the revised plan and later be updated after the Monday appointment.

The learner and instructor need to decide how Thursday's first 35 minutes will be used and what will happen during the 25-minute device turn. They also need a clear handover to Monday: what was done, where the practice file is saved and which action remains. The change is a planning problem with support options, not a test of how much personal pressure a learner can withstand.

Revise the plan without losing the goal

Start by separating **changed conditions, unchanged outcomes and open decisions**. The changed conditions are the shorter Thursday period and limited device access. The outcomes still include accurate information, an authored note, genuine tool use and a reflection based on evidence. The open decision is the agreed completion arrangement. Keeping these categories separate prevents a resource change from silently becoming a lower-quality outcome.

Prioritizing means choosing what must happen before something else. It does not always mean doing the hardest task first. In this case, drafting the note from checked paper information can happen before device access. Saving and locating a file require the actual tool. A final digital check depends on knowing what was entered. Put the tasks in an order that respects those relationships.

Write a revised commitment in plain language. State what will be completed, what remains pending and when the next check will occur. Avoid promising outcomes controlled by someone else. You can commit to attending an agreed appointment or asking for clarification; you cannot guarantee that an unconfirmed device will be

available.

Worked example 3 — make the change visible. The learner plans 25 minutes to draft the note and 10 minutes to review its source labels during Thursday's first 35 minutes. During the 25-minute device turn, the learner enters and checks the data and saves the file, recording the location. Monday's 10-minute device appointment is reserved for finding/reopening the file and checking the remaining digital evidence. The separate five-minute paper-review period is used to update the reflection. The exact tool actions must be observed; the plan alone does not prove they occurred. The revised record keeps Friday's partial review and Monday's agreed completion distinct.

AD-10 · Identify what changed

Make three columns: changed condition, unchanged outcome and decision to confirm. Use the update to place at least two details in each relevant column. Calculate the reduction in Thursday work time and the difference between the original digital allocation and Thursday device access. Explain why the 10-minute appointment is a support option, not permission to mark Digital complete before it occurs.

AD-11 · Revise a goal and schedule

Write a revised folder goal that preserves the required evidence and uses the offered arrangement or a clearly labelled proposal. Build a 60-minute Thursday plan and a separate Monday follow-up. Show Thursday's first 35 minutes and final 25 minutes clearly; distinguish Monday's 10-minute device appointment from the separate five-minute paper review. Identify what will be ready for Friday review, what remains pending and the confirmation needed before treating a new deadline as agreed.

AD-12 · Communicate the revised commitment

Write or rehearse a short update to the instructor. Include the changed condition, your proposed order of work, one support request and how you will record unfinished evidence. Ask the listener to restate the plan. Correct any misunderstanding. Keep private reasons out of the message unless you choose to share them; the task is communicating a workable learning arrangement.

Use feedback as information for the next attempt

Feedback is most useful when it names a feature you can inspect and an action you can try. “Your note is unclear” may be true, but it leaves you searching for the problem. “The note names the contractor but does not identify the road owner; add the role from the brief” points to a specific revision. You can ask for that level of detail when feedback is too broad.

Receiving feedback does not require agreeing with every suggestion. Compare the suggestion with the task purpose and evidence. If it seems to conflict with the brief, ask a clarifying question. If it is about preference, consider whether a reader test would help. A reasoned decision to retain accurate wording can show thoughtful review, provided you can explain the decision.

An improvement record should include what changed and what difference it made. Keep the earlier attempt where possible. A before-and-after pair can show learning more clearly than a final polished product alone. It can also show that one strategy did not help and needs replacing. That is useful information for the next lesson, not something to conceal.

Case document 3 · Feedback on the project note

Fictional learner draft. “Pathway Paving owns the Willow Reach road and gets $120,000 profit. We will use all the same rules on every project. My computer work is finished.”

Source facts available for revision. In the practice brief, the Town of Willow Reach owns the road and Pathway Paving Company performs the contracted work. The $120,000 is the total fictional funding, not a profit figure. Applicable requirements depend on the actual project and authorized documents; the historical source labels are not a complete statement of current rules. The learner has entered and saved a practice table but has not yet demonstrated finding and reopening the file.

Instructor feedback. “Your note is brief and names the practice project. Check the owner/contractor distinction, replace the profit claim with the correct funding label, and state which digital action remains. For requirements, name the need to confirm current applicable documents rather than saying all projects use the same rules.”

The learner does not need to defend the first draft as a personal achievement or discard everything in it. The useful next action is to compare each statement with the available facts and revise the misleading parts. Keeping the short format may still serve the reader well.

AD-13 · Turn feedback into actions

Convert the instructor feedback into a revision checklist. For each item, identify the source detail to check and the change needed. Keep one useful feature of the original draft. Explain why “try harder” would provide less guidance than this checklist. The task is to use feedback, not to write a judgement about the fictional learner.

AD-14 · Revise and compare

Write a corrected version of the note using the source facts. Then compare the first and revised versions, naming at least three substantive changes. Include an honest statement about the pending digital action. Ask a partner to identify the owner, the meaning of $120,000 and what remains unfinished. Use their response to check whether your revision worked.

AD-15 · Prepare for another change

The Monday device appointment is confirmed, but the learner will use a different computer with a different folder layout. Create a short preparation plan that preserves the learning goal without assuming the same screen arrangement. Name the information to bring, one step to check with the instructor and how to record the result. Do not put actual passwords or personal records in the plan.

Keep a record of learning over time

One task shows what happened under particular conditions. It does not tell the whole story of your adaptability. A useful record includes the original goal, the change, your selected response, support used, the result and a next step. Several records over time can reveal strategies that help you and situations where different support is needed.

Your goals can also change for good reasons. You may learn more about a role, discover a useful interest or find that an original timeline does not fit available resources. A revised goal should explain what changed and why the new goal remains meaningful. Changing a goal thoughtfully is different from claiming that an unmet goal was completed.

AD-16 · Test a strategy in a new task

Choose a short unfamiliar classroom task with the instructor, such as reorganizing a practice checklist or finding information in a different supplied document. Predict one difficulty and choose a strategy. Try the task, record what happened and decide whether to keep or adjust the strategy. Distinguish your prediction from the observed result and record any support.

AD-17 · Build a one-week practice plan

Plan two short practice opportunities for one skill from this chapter. Give each a task, available resource, check and possible support. Include one reasonable backup if the resource is unavailable. The dates and commitments can be fictional. Explain how you will decide whether to continue the goal, change the method or ask for a different learning arrangement.

AD-18 · Review all six components

Select evidence for each component from your activities. Identify an action you completed, any support used and any component still needing observation or practice. If all intended evidence was collected independently, record that accurately and choose a new practice challenge. Choose a next goal that can be checked through a task. If you plan to use the strategy in work or community life, record that as a transfer plan; do not claim workplace transfer before there is evidence.

Supported practice and extension

For a supported route, use a printed before-and-after plan and work through one changed condition at a time. An instructor can model the first clarification, help record a selected strategy and observe a small retry. For an extension, combine two changed conditions and ask a new partner to check whether your revised commitment is clear. Keep challenge proportionate to learning; surprise, distress and personal disclosure are not required ingredients.

Source and design note. Component names come from SkillPlan's March 2024 guide, p.99. Feedback, self-directed learning, supported variation and assessment considerations inform this chapter (pp.100–105). The schedules, records and activities are original ACCESS IS4S simulations. The local evidence descriptions are not official proficiency levels, and the task strategies are educational choices rather than clinical treatment advice.

Creativity and innovation — notice, make, test and improve

Useful ideas can begin with an ordinary question

Creativity and innovation involve imagining possibilities, developing ideas and putting them into use. You do not need to be an artist, invent a product for sale or produce an idea nobody has ever had. An idea can be new to you or useful in a particular setting. A clearer information card, a better way to organize a practice kit or a different explanation of a number can all make learning and work easier.

You may already create solutions when materials are limited, when a familiar approach does not suit a person or when a task needs a different explanation. This chapter makes that process visible. You will practise asking questions, generating several possibilities, selecting one for a reason, making a small version and learning from a reader or user's response.

Creativity also involves care. Changing a classroom filing method is different from changing an approved equipment procedure. Ideas that affect safety, privacy, community knowledge or someone else's work need the appropriate boundaries and permissions. A useful question is, “What can we try safely in this learning task, and who needs to guide a real change?”

In an ACCESS IS4S classroom, learners bring different experiences and ways of making meaning. You may choose to draw on your own experience, but you do not need to provide cultural knowledge, tell a personal story or make an object represent your identity. This chapter uses original fictional classroom cases. It does not supply Nation-specific designs, teachings or claims about a single Indigenous way of being creative.

A useful design is developed with attention to the people who will use it. An urban learning centre and a smaller B.C. community may need different information arrangements, and two learners in the same room may prefer different formats. Ask about the actual task and invite input. The connection to people and place comes through purpose, relationships and appropriate local direction, with learners deciding what they wish to contribute.

Component	What you will practise	Main evidence
1. Use your imagination and curiosity	Ask questions and explore another possibility before settling on an answer.	CI-01–CI-03
2. Identify opportunities for you to innovate	Locate a useful change within the task's purpose and boundaries.	CI-02–CI-04
3. Generate ideas that are novel to yourself or others	Make several genuinely different options.	CI-05–CI-07
4. Develop your ideas	Add details, compare features and prepare a usable prototype.	CI-08–CI-10

Component	What you will practise	Main evidence
5. Apply your ideas	Try the prototype, observe results and improve it.	CI-11–CI-15
6. Facilitate a creative and innovative environment for yourself and others	Make room for ideas, give useful feedback and share work by agreement.	CI-06, CI-12, CI-16–CI-18

Case document 1 · The practice-card shelf

Fictional classroom design brief. A training room has three kinds of practice kits. Learners use the kits in pairs, then return the cards to a shared shelf. The next pair sometimes finds a mixed or incomplete kit. The instructor wants a simple classroom system that helps people find the right kit, notice missing pieces and return it without needing to remember every item.

The **Paving Process kit**, code P, contains five stage cards, six equipment-purpose cards and one instruction card: 12 cards in total. It supports introductory learning about the sequence pit or quarry → plant → haul → place → compact. It does not contain machine-operation instructions. The **Number Check kit**, code N, contains one fictional data table, one worked example and two blank record sheets: four items. The **Communication kit**, code C, contains four message cards, two role cards and one check-back checklist: seven cards.

The room has one complete kit of each type. All kit names, counts and observations in this chapter are invented for practice. In four fictional classroom sessions, learners spent 6, 8, 4 and 7 minutes finding or sorting the materials before they could start. Those observations suggest a problem to investigate; they do not prove why it happens or show that every learner has the same difficulty.

The instructor offers plain folders, scrap paper, markers and removable labels for a prototype. A small supply budget may be proposed, but no purchase will be made in this activity. The system must work in black and white, use plain-language labels and avoid putting learners' names or personal information on the shelf. It must fit on one shelf and be easy to reset when a kit changes.

The team can change labels, organization and classroom checking steps. It cannot discard the source cards, invent new equipment facts or require every learner to read small print. A learner should be able to ask for a supported explanation. The design must help people use the materials, not shame someone when an item is missing.

CI-01 · Notice before proposing

Read the brief and list three things you know, three questions still open and one assumption you should avoid. Identify the evidence that suggests an opportunity for improvement. Explain why the four waiting-time observations do not, by themselves, prove that learners are careless or that a particular storage system will solve the problem.

CI-02 · Define the useful change

Write a design question beginning, “How could we help a learner…” Include finding, checking or returning a kit. State the intended user and one limit from the brief. Avoid putting a preferred solution into the question too early. Compare your question with a partner's and explain which wording leaves room for more than one useful approach.

CI-03 · Ask from another viewpoint

Review the shelf from three fictional viewpoints: a first-time learner, a learner who wants larger print and the person resetting the room. Write one question from each viewpoint. Use the brief to identify which questions can be answered now and which need a simple user check. Do not ask a classmate to disclose a disability or represent a whole group of learners.

Curiosity turns an inconvenience into a design question

When a familiar task goes wrong, it is easy to jump to a solution or blame the person nearest the problem. Curiosity creates a pause. Ask what happened, what information was available, what the task required and which part caused difficulty. A missing card might reflect unclear labels, an incomplete starting kit, mixed storage, a changed activity or an uncertain return process. The same visible result can have several explanations.

Observation should be specific. “The kits are a mess” is a broad judgement. “The Number Check folder contains a Paving Process stage card, and its worked example is missing” identifies something a person can inspect. Specific observations help you choose what to test and avoid redesigning everything at once.

An opportunity for innovation is a useful gap between the current situation and the intended result. It does not require a dramatic new invention. If people cannot tell which pieces belong together, a visible contents list may help. If the list is difficult to use, the next idea may involve larger labels, a matching layout or a supported check. Keep asking whose task becomes easier and how you will know.

Worked example 1 — frame the opportunity. A learner first writes, “Make everyone use a better folder.” That statement already chooses a solution and puts the burden on the user. After reading the brief, the learner revises it to: “How could a first-time learner find and check the Number Check kit without remembering its contents?” This question points to a user, a task and a need. It leaves room for a contents card, a matching arrangement or another useful approach.

CI-04 · Compare two design questions

Compare “How can we stop people losing cards?” with “How can the shelf show what belongs in each kit and make a missing piece easy to notice?” Identify an assumption in the first question and a testable feature in the second. Rewrite the first question so it focuses on a useful change without assigning blame. State one thing your revised question still does not establish.

Generate options before choosing one

Idea generation and evaluation are different parts of the work. If you reject every idea as soon as it appears, you may end with only the first familiar approach. If you never evaluate ideas, you may choose something attractive that does not meet the brief. Give each part its own time: first make several possibilities visible, then compare them against the task.

You can generate ideas through lists, sketches, spoken descriptions, a simple model or an accessible tool. The form should help you think, not become a test of drawing skill. Try changing one feature at a time: where the information appears, how pieces are grouped, how a missing item is shown or how a person asks for help. You can also combine useful features from different ideas, while crediting contributions.

“Different” means more than changing the colour of the same design. A folder with a contents list, a board with matching spaces and a small check-out card use different ways to guide the user. Each may have strengths and limits. The goal is not to produce the most ideas at any cost; it is to create enough variety to make a considered choice.

A respectful idea session allows uncertainty. Someone can say, “This is an early thought,” or “I can explain it better with a sketch.” During the first generation round, ask clarifying questions and build on possibilities. Later, give specific feedback against the agreed criteria. Respect for the person does not require accepting an inaccurate fact or an unusable design.

CI-05 · Generate three different options

Create three options for the practice-card shelf. Use any combination of words, sketches or a simple model. For each, explain how a learner would find a kit and notice a missing item. Make the options different in their organization or checking method, not just colour. Mark one question that would need testing before you could recommend each option.

CI-06 · Help another idea develop

With a partner, take turns sharing an unfinished option. The listener asks one clarifying question and offers one possible extension, such as adding a larger label or changing where a contents list appears. The author decides what to use and explains why. Record the contribution with permission. Notice whether the conversation helped the author think, rather than replacing the author's idea with the listener's.

CI-07 · Break one unnecessary assumption

Choose an assumption such as “every kit needs a separate colour,” “instructions must be a full page” or “the first draft has to look finished.” Explain why the brief does not require it. Generate another approach that still meets the actual requirements. Identify one important limit that you must keep, such as accurate source content, no personal data or black-and-white usability.

Case document 2 · Three possible prototypes

Fictional design notes. A group develops three ideas. **Option A: labelled folders** uses one folder per kit, a large code and name on the front, and a contents list inside. A small “check needed” marker can be placed on a folder when something is missing. The marker identifies the kit status, not the person who last used it.

Option B: a matching board shows an outlined space and label for each kind of item. Learners place returned items beside the corresponding labels. The board makes some gaps visible, but the group is unsure whether it will fit the shelf or whether small cards will stay together when moved.

Option C: a shared return tray has one large sign and a short return checklist. An assigned classroom helper checks the tray at the end of the activity and rebuilds the kits. This may make the learner's immediate return task simple, but it creates a recurring responsibility and a possible delay before another pair can use the materials.

The instructor gives four criteria: the system must show the correct contents; a new user must be able to follow it; it must work without colour; and it must be manageable when the kit changes. The group may add one justified criterion, such as fitting the available shelf. It should not choose a design simply because the most confident member prefers it.

The group has enough scrap materials to make one rough prototype. It is not being asked to buy supplies, publish images or change the real training room permanently. Its recommendation should explain both the useful features and the questions that remain after a small classroom test.

Develop an idea so someone else can use it

Development adds the details that turn a possibility into something testable. Decide what the user sees first, what they do next, how they check the result and what happens when something is missing. A rough prototype can be a folded paper, a labelled folder, a sketch with movable pieces or a short spoken walkthrough supported by an accessible record.

Use the real requirements of the practice brief as your criteria. A beautiful design that relies only on colour does not meet a black-and-white requirement. A complicated tracking sheet may record many details but be harder to use than the task requires. More features are not automatically better. Each feature should help the intended person complete the task or understand the information.

A comparison table can help you choose, but it cannot make the decision for you. Before testing, “easy to use” is a prediction. Label it that way. After testing, you can report what a particular user did under particular conditions. Keep uncertain information visible so a small classroom trial does not become a claim that a design works for everyone.

Worked example 2 — turn an idea into a prototype. The group selects labelled folders for a first test. It writes “N — Number Check” in large text, then lists “1 data table; 1 worked example; 2 blank record sheets; total 4 items.” It adds a “check needed” slip and a short instruction: “If an item is missing, leave this slip with the folder and tell the instructor.” The group has not proved the system works, but another person can now try a clear sequence and report what happened.

CI-08 · Compare features with reasons

Make a comparison table for Options A, B and C using the four given criteria and one criterion you can justify. For each option, record a likely strength, a likely limitation and a question to test. Mark predictions as predictions. Select a first prototype and explain the choice without claiming that the other options have been disproved.

CI-09 · Specify the prototype

Prepare the words, arrangement and checking steps for your selected option. Use the correct kit contents from Case document 1. State what the user should do when something is missing and how the kit will be updated if its contents change. Ask a partner to describe the sequence from your specification. Revise any step they have to guess.

CI-10 · Make a small usable version

Build a prototype with paper or an accessible tool. Include at least one complete kit representation, accurate labels and the missing-item response. You may use dummy cards rather than the original kit. Record which parts are ready to test and which are only suggested for a later version. Artistic polish, expensive supplies and cultural decoration are not required.

Test the task, not the user's worth

A test gives the user a task and observes what happens. For the Number Check prototype, you might ask, “Find this kit, check whether it is complete and show what you would do if the worked example were missing.” Avoid explaining the design while the person is trying it, unless that support is part of the intended use. If you help, record the help so the result is not reported as independent use.

Ask permission before observing or keeping feedback. Use fictional role labels rather than personal information. A user can choose not to take part. The purpose is to learn about the design, not to rank classmates by speed or make someone feel responsible for a confusing instruction. If a person pauses or misinterprets a label, ask what information they were looking for.

Separate observation from interpretation. “The user opened two folders before finding N” is an observation. “The user is careless” is an unsupported judgement. “The code may need to appear on the shelf edge as well as the folder” is a possible design explanation to test. Keeping these separate helps the next revision address the actual difficulty.

CI-11 · Plan a fair small test

Write a task for a willing partner using your prototype. Include what you will observe, what support is available and how you will record feedback without personal data. Add one question that asks about the design rather than the person's ability. Explain why a successful test with one person would still leave limits on your conclusion.

CI-12 · Give and receive useful feedback

Exchange prototypes with another learner or pair. Give one specific observation, one question and one suggestion tied to the brief. The author restates the feedback, decides what to use and explains the decision. If testing is not available, rehearse with the instructor and label the result as a supported walkthrough. Do not present a rehearsal as an independent user test.

Case document 3 · Results and a changed requirement

Fictional test record. A first-time user finds the Number Check folder after reading its large name and code. They count the data table, worked example and two blank sheets correctly. When the worked example is removed for the next trial, they notice that there are only three items but do not know where to put the “check needed” slip. The slip's instruction is printed on its reverse side, which the user has not seen.

A second user says the contents list is easy to find but asks whether used record sheets are returned or replaced. The original brief does not answer that question. The instructor clarifies the classroom rule for this fictional case: used record sheets stay with the learner's practice work; the kit is restocked with two blank sheets before reuse. No learner names are written on the folder.

The instructor then changes the kit. The Number Check kit will contain a second worked example, so its new contents are one data table, two worked examples and two blank sheets: five items. The system must show which version is current and prevent an old four-item list from being treated as the new requirement. The group has time for one revision and another small test.

The first prototype has useful features worth keeping. The large name and code helped the first user find the kit. The clear inventory supported counting. The revision should address the slip location, the restocking instruction and the changed contents without making the front of the folder crowded or blaming the users for the original gaps.

Worked example 3 — revise from evidence. The author moves the missing-item instruction to the visible face of the slip, adds a marked pocket for it and writes “Version 2 — five items” beside the new contents list. The author adds, “Keep your used record sheets; ask for two blank sheets before returning the kit ready for reuse.” A second user tries the changed kit and explains the return steps. The record states what that user could do and what support was given. It does not claim the design has solved every future storage problem.

CI-13 · Separate findings from guesses

Make three columns for Case document 3: observed result, possible explanation and next check. Include the hidden instruction, the used-sheet question and the changed item count. Identify a useful feature to retain. Explain why the second user's question reveals missing information in the design rather than proving that the user failed to read carefully.

CI-14 · Revise for the changed kit

Update your prototype or the labelled-folder example for the five-item Number Check kit. Make the version change clear, include the clarified restocking rule and improve the missing-item response. Keep an earlier version or a description of it. Explain how each revision answers evidence from the test or a changed

requirement, rather than adding an unrelated feature.

CI-15 · Retest and make a limited claim

Ask a willing user to try the revised version, or use an instructor-supported walkthrough if needed. Record whether the user can find the kit, identify its five required items and explain the missing-item and used-sheet steps. State the conditions and support. Write a conclusion that describes the result accurately and names one question that would need further testing before broader use.

Help ideas grow without taking them over

A creative environment is built through ordinary choices. People need access to the task, materials and time to think. They need to know whether a suggestion is an early possibility or a final decision. They need feedback that can be used and an opportunity to revise. Credit matters too: ask before displaying a person's work or combining it into another product, and name contributions in the way the person agrees.

You can support another learner's idea without treating it as yours to finish. Ask what they are trying to achieve, what is uncertain and what kind of feedback would help. Offer options rather than instructions when the task allows choice. If the idea contains an inaccurate source fact, address that fact clearly while leaving room for a different design solution.

Reflection can also recognize a useful failure. A prototype may reveal that the problem was framed too narrowly or that an important user task was missing. That finding can improve the next attempt. The learning evidence is not simply the number of ideas or whether the finished object looks attractive. It includes how you investigated, developed, applied and improved the idea, and how you made that process possible for others.

CI-16 · Facilitate a short idea session

Lead a small idea session about another classroom improvement, such as making a practice schedule easier to read. State the purpose and limits, offer more than one contribution mode and separate idea generation from evaluation. Invite participants to decide how their contributions may be recorded. Afterwards, ask what helped them think and choose one facilitation improvement.

CI-17 · Transfer the process with boundaries

Choose a fictional office, training or community-room task that could benefit from a clearer form, label or information aid. Describe the user, opportunity, two possible ideas and a small test. Identify who would need to approve a real change and what information or knowledge should not be copied without permission. Do not propose altering live equipment procedures as a classroom creativity exercise.

CI-18 · Assemble your idea-development record

Keep your design question, three options, comparison, prototype, test notes and revision. Use them to identify evidence for all six components. Name one idea contribution from another person and how you used or declined it respectfully. Choose a next practice goal. If a component has not been observed, name the task that could provide evidence instead of claiming the whole skill from the finished object alone.

Supported route and extension

For supported practice, use one kit, a partly completed contents list and an instructor model of a test question. Generate two options first, then add a third by changing one feature. For an extension, test with a different task or revise after a new content requirement. A digital prototype can develop Digital as well, but paper work is a valid route for the creativity outcomes in this chapter.

Use the local evidence descriptions **Not observed, Not yet demonstrated, Demonstrated with support,** and **Demonstrated independently** for the stated task. These are not official proficiency levels. A plan to use the design process elsewhere is a transfer intention; a later documented task provides stronger evidence of actual transfer.

Source and design note. Component names come from SkillPlan's March 2024 guide, p.106. Real-world application, structured idea development, inclusive participation and performance evidence inform the chapter (pp.107–113). The kit cases, counts, prototypes and activities are original ACCESS IS4S teaching materials. Specific community knowledge remains under appropriate local direction; this chapter does not claim cultural endorsement or validated proficiency scoring.

Put the nine skills to work together

These projects let you plan something useful, explain your decisions and respond when the information changes. Each project contains all the notices, prices, quantities and conditions needed for the questions. The organizations and arrangements are fictional. Use the supplied information as a classroom case; do not treat it as a live event, booking or purchasing instruction.

You can complete a project with a partner or small group, but keep your own work and take your own turn with the digital tool. For Communication and Collaboration, an instructor or another learner can be your partner. A written script can prepare you for an interaction; it does not replace the interaction. You may use an accessible communication method agreed with your instructor.

Use a spreadsheet or an accessible table application for the digital tasks. You need to enter information, check it, save it and find it again yourself. If a device is unavailable, complete the planning on paper and record Digital as not observed until you can demonstrate the tool actions. You do not need to create an online account, post publicly or use personal information.

Keep first drafts and revisions. The change is part of the task, not a trick. Your work should show what changed, what you kept, what you revised and why. The answer guide gives model responses and calculations; other responses can work when they meet the stated conditions and explain their evidence.

Project 1: A training information morning

A fictional Learning Centre is preparing a short information morning for people considering a training course. You are helping the planning team make the arrangements clear and keep supplies within the available budget. No cultural activity or personal disclosure is required. The purpose is to help participants know where to go, what to expect and whom to ask.

Your planning package contains three initial documents and one later change card. Work with the initial documents for CP-01 to CP-04. Read the change card before CP-05 and use the updated information in CP-06. Do not erase the first plan; label its version so another person can follow your decisions.

Document A: current event notice, version 2

Learning Centre — Training information morning
Date: 14 May 2027
Session: 9:00–10:30 a.m.
Place: Learning Centre, Room A
People: 18 learners and two staff members
Contact: Ask the Learning Desk for clarification.
Version: Version 2, issued 5 May 2027. It replaces the earlier message below.

Part of the morning	Time
Welcome and check-in	9:00–9:10
Course information	9:10–9:30
Try a practice task	9:30–10:10
Questions and review	10:10–10:25
Pack up	10:25–10:30

Participants do not need to bring a device. The centre supplies the practice materials. Participation in the morning does not reserve a course place; the Learning Desk will explain the application process. Learners may ask privately about access or support arrangements. The planning team should not collect personal support information in a public sign-up sheet.

Document B: earlier message and room information

Earlier message, version 1, issued 1 May 2027: “The information morning is planned for 8:30–10:00 a.m. in Room B. We will send a final notice.” This message is retained so the team can identify what needs correcting. Version 2 is the current notice.

Room	Maximum people, including staff	Information for the initial plan
A	24	Booked for this event at the times in version 2.
B	18	Mentioned in the earlier message; not the current booking.

Count every learner and staff member when checking room capacity. A room that fits the learners alone may still be too small for the event. No other rooms or bookings are part of this case.

Document C: initial supplies quote

The budget is **$160.00**. Prices include all charges for this exercise; add no tax or delivery amount. Items can be bought individually in the quantities shown. Buy one notebook and one snack pack per learner. Buy one pen, one handout and one water per person, including staff. Staff do not need notebooks or snack packs in this plan.

Item	Initial quantity	Price per item
Notebook	18	$2.50
Pen	20	$0.80
Handout	20	$0.15
Water	20	$1.00
Snack pack, option 1	18	$3.00

The initial plan uses snack option 1. A later change card will provide another option. There are no other costs to include. This limited table is a practice budget, not a complete real-world event budget.

CP-01 — Read the plan and identify the current instruction

Create a short planning note answering these questions: What is the current date, session time and room? Which document establishes that it is current? What changed from version 1? How many people will be in the room? Does Room A fit them, and how many places remain within its maximum? Would Room B fit the same group?

Calculate the total session length and check it by adding the five activity durations. Identify two things the notice tells participants about preparation or next steps. Also name one matter that should go to the Learning Desk rather than being guessed. Point to the relevant line, table or condition for each answer.

Your aim is to show how you used the documents, not simply to give a likely event plan. Keep the note so you can compare it with the later change. Reading is the focus; an oral explanation with pointed evidence is acceptable if you and your instructor agree how to record it.

CP-02 — Build and check the initial budget

Estimate whether the initial supplies are likely to cost less than $160. Then make a digital table with the headings **Item, Quantity, Price each, Line cost**. Enter all five items and calculate each line cost. Use formulas if you know how; if you enter calculated values, show your separate calculations and check the entries. Add the total and the money remaining.

Check the result in a second way. You could add grouped costs, use a calculator after a spreadsheet calculation, or compare the total with a reasonable estimate. Include dollars and cents and explain whether the budget is sufficient. Do not add quantities with different purposes and call that number the event size.

Save the file as `CP01-budget-v1` in an agreed folder. Close it and find or reopen it. Show your instructor or partner the saved file and explain your check. Record the application, any formula used and any support needed. This is evidence of local digital work; it does not show online research or online-platform skills.

CP-03 — Give a clear briefing and work toward agreement

Work with a partner. In the first round, you are the organizer and your partner is a prospective participant. Brief them using the current notice. Your partner uses this role card: **“I saw the earlier 8:30 message. I want to know when and where to arrive, whether I need a device, and whether attending means I have a course place.”** The partner asks at least one clarification and checks the answer back in their own words.

Swap roles so each person explains and receives information. Together, agree the three details that most need to appear at the top of a participant message. If you prefer different priorities, explain your reasons and check the notice before deciding. Neither person should have to agree without understanding the other’s reason.

Record your own contribution, one useful question from your partner and the shared decision. Your instructor observes whether the briefing is accurate, whether meaning is checked and whether both people contribute. A fluent-sounding speech alone is not the whole outcome; listening and responding matter too.

CP-04 — Write the first participant message

Write a message of about 80–120 words for someone who saw version 1. Give it a useful subject or heading. Correct the old time and room, state the date and current time, explain what participants need to bring, distinguish attendance from a course reservation, and identify where to ask questions. Use information from the supplied notice without inventing a contact address or application deadline.

Ask your partner to read it and state when and where they would arrive. Ask what they would do if they needed clarification. If their interpretation differs from your intention, revise the wording. Keep both versions or mark the edit clearly.

Label the final first-stage message **Version 2 information — before change card**. This is a writing task: produce text you control and can revise. You may use an agreed authoring tool. A conversation about what the message might say is preparation, not the completed message.

Change card: issued 8 May 2027

Four more learners will attend. There are now **22 learners and two staff**. The event remains on **14 May 2027 in Room A**, but the booking has moved to **10:00–11:30 a.m.** Keep the same sequence and length of activities. The budget remains **$160.00** and the per-person supply rules remain the same.

Snack option 1 is still available at **$3.00 each**. Snack option 2 is now available at **$2.50 each**. Either option meets the case requirements; choose one type for all 22 learners. Buy all required supplies. The Learning Desk remains the contact. Do not claim that the room, registration process or device requirement changed; the card does not say that.

CP-05 — Solve the revised budget and update the plan

List what changed and what stayed the same. Check the new total number of people against Room A's maximum. Recalculate the quantities and costs using snack option 1. State exactly whether that plan meets the budget. Then calculate the full plan using snack option 2 and select a workable response with a reason.

Update the five activity times to start at 10:00 while preserving their lengths. Save your revised budget as `CP01-budget-v2` so the first version remains available. Check that the new quantities follow the learner/person rules and that the saved file contains the revised total. Explain one check that helped you catch or avoid an error.

Record how you adjusted your approach. You might compare versions side by side, mark changed quantities before calculating or ask a partner to interpret the revised schedule. The evidence is the adjustment you made and its result; you do not need to describe private feelings or personal experiences of change.

CP-06 — Create, test and improve a final information sheet

Sketch two different ways to organize a one-page participant sheet using the revised information. For example, you might compare a short checklist with a compact schedule-and-questions layout. Both must make the current date, time, room, preparation and contact clear. Choose one with a reason related to the reader. Originality here means developing a useful approach for this task, not inventing a new kind of event.

Create a final sheet of **no more than 100 words**, excluding its heading. It must remain understandable in black-and-white print; do not use colour alone to identify changes. Include a clear correction to the earlier time. Ask your partner to use the sheet to answer: “When and where do I arrive? What should I bring? Does this reserve my course place? Where do I ask?” Note one response and improve the sheet if needed.

Keep your two sketches, chosen version, reader-test note and final revision. Add a short reflection naming one skill you used effectively, one support or strategy that helped and one task you want to try next. Do not describe the project as official event-planning certification.

Project 1 evidence check

Skill	Evidence from your own work
Reading	CP-01 uses the current document and identifies its conditions.
Writing	CP-04 and CP-06 produce and revise reader-focused text.
Numeracy	CP-02 and CP-05 show quantities, costs, capacity, durations and checks.
Digital	CP-02 and CP-05 show your own table entry, checking, saving and reopening.
Problem solving	CP-05 identifies the budget issue and justifies a workable option.
Communication	CP-03 includes an accurate briefing, clarification and check-back.
Collaboration	CP-03 records both contributions and a shared decision; CP-06 uses reader feedback.
Adaptability	CP-05 records changes and implements a revised plan.
Creativity and innovation	CP-06 compares two layouts, develops one and improves it through a trial.

Project 2: A community learning-room session

A fictional Community Learning Room will host a practice session using tablets and printed activities. You are helping arrange the resources so every learner can take part. People may choose the supplied fictional examples; nobody has to use a personal account or reveal private information. Your task is to plan access, explain the arrangement and revise it when equipment availability changes.

The project begins with a confirmed group and an initial resource count. Later, two more learners join and some equipment becomes unavailable. The goal is a workable plan within the existing time, room capacity and printing budget. You are planning a learning activity, not repairing devices or changing the building’s procedures.

Document D: session brief

Date: 21 May 2027
Session: 1:00–2:30 p.m., Community Learning Room
Initial group: 12 learners and two helpers
Room maximum: 16 people, including helpers
Contact: The Session Coordinator, available at the room’s front desk.

Learners work in pairs, initially named **A, B, C, D, E and F**. Each pair needs one **20-minute tablet activity** and one **20-minute printed activity**. Within the tablet activity, each learner controls the device for ten minutes. Each station block lasts 25 minutes, including five minutes for checking, saving and moving. The printed activity can run at the same time as the tablet activity.

Part	Time
Orientation	1:00–1:10
Station block 1	1:10–1:35
Station block 2	1:35–2:00
Break	2:00–2:10
Shared review	2:10–2:25
Return resources and finish	2:25–2:30

Initially, all six pairs may do tablets in block 1 and printed activities in block 2. A different rotation is allowed if every pair completes both activities. The session must finish by 2:30. Do not shorten the 20-minute activities, ask learners to bring personal devices or assume extra helpers.

Document E: resource desk count before the change

Resource	Total owned	Unavailable	Available for this session
Tablets	8	2	Calculate this.
Calculators	12	1	Calculate this.
Reusable folders	18	2	Calculate this.
Chargers	15	2	Calculate this.

Unavailable items cannot be used in the plan. Each pair needs one calculator. Each learner needs one folder. Each tablet in use needs one charger. These resources have no borrowing charge in the case and are returned before the session ends. Only the printing and labels below use the **$15.00** supplies budget.

Document F: printing and label quote

Item	Quantity rule	Price
New practice pages	Six pages for each learner; helpers do not need a set.	$0.12 per page
Name labels	One for each learner and helper.	$0.10 each

All charges are included. Items can be bought in the exact quantities needed. Do not assume labels need real names; participants can use agreed practice names or pair labels. A supplier can provide additional working tablets for the session at **$6.00 each**, including a charger. Any rental would use the same $15.00 budget as

printing and labels. No other funds are available.

CP-07 — Read the requirements and find the limits

Write a planning note identifying the initial total people, room capacity and remaining places. Calculate the available count for each resource in Document E. Explain whether the initial six-pair plan has enough tablets, calculators, folders and chargers. Show the needed and available quantities rather than simply saying “yes.”

State how long the session lasts, how long each station block lasts and how much tablet-control time each learner receives. Identify three conditions a revised plan must preserve. Explain the difference between a resource being owned and being available. If the source does not confirm that a device works, would you count it as available? Explain using the case’s rule.

Keep your note as the baseline. It should help someone unfamiliar with the session understand the purpose and limits without reading every planning discussion.

CP-08 — Create the resource and cost tables

Make a digital resource table with columns for **Resource, Total, Unavailable, Available, Initially needed, Spare**. Calculate the entries for the initial plan. Keep the resource types separate; adding all the spare items together would not tell you whether there are enough tablets.

In a second table, calculate the initial number of printed pages, printing cost, number of labels, label cost, total cost and money remaining from $15.00. Estimate and then check the total. Explain why the helpers count for labels but not for practice-page sets.

Save the work as `CP02-plan-v1`, close it and find or reopen it yourself. Demonstrate one correction or verification of an entry. Keep the original work available for the later change. Record any formulas or assistance used. The digital evidence concerns the tool actions you actually perform, not a partner’s completed file.

CP-09 — Explain the rotation and agree how to support access

Work with a partner. One person is a helper; the other uses this learner role card: **“I want to know whether I get my own turn on the tablet. I would prefer a printed reminder of where to go next. I do not want to use a personal account.”** Explain the initial plan using the brief. The learner asks a clarification and checks the answer back. Swap roles so both people practise receiving and explaining information.

Together, choose a clear way to show pair assignments and the next station. Agree how you will avoid one partner controlling the device for the whole activity. You can use a timer, a visible turn note or another workable reminder that fits the supplied conditions. The learner does not need to explain why a support would help.

Record the shared plan, your contribution and one way your partner’s input improved it. Ask the instructor to observe the exchange. Writing “we listened” is less useful than noting the question that changed the plan.

CP-10 — Write an initial helper handover

Write a handover of about 80–120 words for the two helpers. Include the date, time, initial number of learners and pairs, room-capacity check, resource quantities needed, the two station blocks and the ten-minute device turn for each learner. State where an unresolved question should go. Use the supplied facts; do not promise services or equipment that are absent from the brief.

Ask your partner to explain the plan after reading your handover. Check whether they can distinguish a 20-minute activity from a 25-minute station block. Revise any wording that could lead them to skip the five-minute transition or keep the tablet with only one person. Label this handover as the initial plan so it can be distinguished from the revision.

Change card: confirmed before the session

There will now be **14 learners and two helpers**, forming seven pairs **A–G**. Two of the tablets previously counted as available are now unavailable. This makes **four working tablets available**, not six. The other resource counts are unchanged. The room maximum, $15.00 supplies budget, date, session times and activity lengths are unchanged.

You may rotate groups between tablets and printed work. Everyone still needs both activities and an individual ten-minute tablet turn. You may compare rental with rotation, but any rental must fit the same $15.00 budget. There is no permission to use personal devices, reduce practice time or increase the room maximum.

CP-11 — Compare options and revise the plan

Check the changed attendance against room capacity. Recalculate pages, labels, costs and remaining money. If all seven pairs used a tablet at once, how many additional tablets would be needed? Calculate the full printing, label and rental cost for that option and decide whether it is possible within the budget.

Create a feasible rotation using the four available tablets. Name the pairs at each station in each block. Show that every pair gets a tablet activity, a printed activity and the required individual turns. Check the needed calculators, folders and chargers against availability. Record why the chosen response meets the constraints.

Save the revised tables as `CP02-plan-v2`. State what changed, what stayed the same and one strategy you used to revise without losing a requirement. If you work with a partner, both people must be able to explain the decision and their own file work.

CP-12 — Design and test a usable station guide

Sketch two ways to explain the revised rotation to participants. One could use a table by time; another could use a short route for each pair group. Choose a design with a reason related to ease of use. Make a guide of **no more than 120 words**, excluding its heading, that works in black-and-white print and states the individual device-turn arrangement.

Ask your partner to act as Pair C, then Pair F. Can they find their first station, second station and move time? Can they explain how both people get a device turn and when the session finishes? Record one observation and make a useful improvement or explain why the tested version already works. Keep the sketches, guide and test note.

Finish with a brief portfolio note: identify an example for each of the nine skills using the evidence table below. Choose one strategy to try in a different situation, and name the new task and how you would check it. This is a transfer plan; record transfer as observed only after you actually try the new task.

Project 2 evidence check

Skill	Evidence from your own work
Reading	CP-07 interprets the brief, availability and limits.
Writing	CP-10 and CP-12 create and revise useful instructions.
Numeracy	CP-08 and CP-11 show resource counts, time, costs and checks.
Digital	CP-08 and CP-11 demonstrate your table work and file management.
Problem solving	CP-11 compares rental and rotation against the same constraints.
Communication	CP-09 includes clarification and an accurate check-back.
Collaboration	CP-09 reaches a shared access plan with both contributions visible.
Adaptability	CP-11 implements the changed group and equipment conditions.
Creativity and innovation	CP-12 develops two layouts, selects one and tests its usefulness.

Sources and next steps

These are original integrated teaching cases. Their use of contextual tasks, explicit practice, feedback and reflection is informed by SkillPlan's *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp.24–42. They sample actions within all nine skills; they do not assess every component or assign official proficiency levels.

Use the answer guidance after an attempt as agreed with your instructor. Retain the evidence that best shows your learning, record support conditions and choose a specific next task. A project completed in class is evidence of that project; workplace or everyday transfer needs a separate opportunity and observation.

Reference and portfolio • Keep evidence you can use

Make your learning visible

A portfolio is a selected collection showing what you can do and what you are practising next. Use a paper folder, an accessible digital folder or both. Choose examples of a useful action, a checking strategy, a revision or a response to a new situation.

You decide which personal connections to share. Fictional cases can demonstrate learning without disclosing family records, community information, identity details or difficult experiences. Ask before including another person's words, image or work. Identify your contribution to shared tasks and follow the program's storage and sharing arrangements.

A practical glossary

These short working definitions help you use the book. They are original explanations for learning, not legal definitions or an official assessment scale.

Term	Meaning in this book
Adaptability	Adjusting your approach or goals when conditions change, while continuing purposeful work.
Assumption	Something treated as true that still needs checking or stating clearly.
Audience	The person or group who needs to understand your message.
Baseline	A recorded starting example used to compare later work under stated conditions.
Calculation	A mathematical operation or sequence used to answer a defined question.
Check-back	Restating or clarifying a message to confirm shared understanding.
Collaboration	Contributing and supporting others to achieve a shared goal.
Communication	Receiving, considering and sharing information through interaction with others.
Condition	A circumstance that affects the task, such as available time, tools or information.
Constraint	A limit or requirement the solution must respect.
Creativity and innovation	Developing, trying and improving an idea that offers a useful new possibility.
Criterion	A stated feature used to judge whether work meets its purpose.
Digital	Using digital tools to find, manage, create, apply or share information responsibly.

Term	Meaning in this book
Estimate	An approximate result used for planning or checking.
Evidence	An observable action, record or product that supports a specific learning claim.
Feedback	Specific information about what worked and what could improve.
Formative practice	Learning activity used to guide improvement and the next teaching step.
Goal	A result you intend to work toward, with a way to recognize progress.
Inference	A conclusion drawn from evidence rather than directly stated in the source.
Iteration	Another version made after trying, checking or receiving feedback.
Measurement	A quantity found using a method and unit, with an appropriate degree of precision.
Numeracy	Finding, using, checking and reporting mathematical information in context.
Observation	A record of what someone actually saw or heard during the task.
Paraphrase	Restating a meaning in your own words while keeping it accurate.
Portfolio	A selected collection of learning evidence with enough context to interpret it.
Problem solving	Understanding an issue, considering options, acting and checking the result.
Reading	Finding, understanding and using information in words, symbols and images.
Reflection	Looking back at an action and its evidence to choose a useful next step.
Revision	A purposeful change to improve a draft, plan or product.
Simulation	An invented practice situation that represents selected features of a real task.
Source	The document, person or record from which information comes.
Support	A tool, accommodation, model or prompt that helps someone complete a task.
Transfer	Applying a learned strategy in a different task or context, with evidence of the application.
Unit	The named quantity used in a measurement or calculation, such as minutes or metres.
Writing	Creating written words, symbols or images to communicate a purpose to a reader.

Choose evidence across the nine skills

Use this table as an index. One project may support several skills, but identify the action behind each claim. Leave a row open when more practice or observation is needed.

Skill	A useful item or observation to collect	My chosen item / activity ID
Reading	A source detail located and correctly used, with an explanation of its meaning.	
Writing	An authored message and revision that make its purpose clearer to the reader.	
Numeracy	Labelled working, a checked result and an explanation of its consequence.	
Digital	An observed tool action plus a file or record the learner can find and explain.	
Problem solving	A defined issue, evidence considered, alternatives and a checked decision.	
Communication	An observed exchange showing listening, explanation and clarification.	
Collaboration	Your contribution, response to another person and effect on a shared task.	
Adaptability	An original plan, a changed condition and a justified revised approach.	
Creativity and innovation	Alternatives considered, an idea tried and an improvement based on testing.	

For examples of a checkable record, revisit Reading, Writing or Numeracy. Choose evidence for your present goal rather than trying to make every artifact demonstrate every skill.

Add a short evidence note

Copy this template for each selected item. A few clear sentences are enough.

Field	Your note
Item title, activity ID and date	
Task and intended result	
Skill and criterion being observed	
What I personally did	
Tools, access arrangements and prompts used	
Evidence location and observer, if applicable	
What the result shows, including any limit	
Feedback and one next practice step	

Field	Your note
Sharing choice or permission needed	

Describe conditions precisely. “Used a calculator to check the total” is more informative than “had help.” “Partner explained which operation to use” records a different kind of support. Agree the task conditions and criteria with the instructor before interpreting independence. Routine access tools do not automatically mean someone else did the reasoning; record what the tool or person actually contributed.

A paper table can demonstrate numerical organization, but it does not establish Digital until tool use is observed. An oral explanation can show understanding, but a Writing outcome needs learner-authored text. Communication needs evidence of the exchange, rather than relying only on a written summary. A group product needs an observation of each person's contribution before it supports an individual Collaboration claim.

Use feedback to choose the next step

These four local descriptions refer to a particular task and criterion. They are not official Skills for Success levels, admission decisions or trade/professional qualifications.

Description	What it records
Not observed	There is not yet enough evidence to judge the task criterion.
Not yet demonstrated	An attempt was observed, but the criterion has not yet been met.
Demonstrated with support	The criterion was met using the recorded task support.
Demonstrated independently	The criterion was met under the agreed conditions without task-solving prompts.

Record transfer separately, with the new situation and evidence named. A result can be independent in a familiar task while transfer to a different task still needs practice. Likewise, needing a reminder on one new task does not erase earlier evidence.

Review the task, evidence, checks, useful support and remaining uncertainty. Choose an observable next action: check units before calculating, or ask a listener to restate a deadline. “Be better at maths” is harder to act on than “show the unit beside every quantity and check the answer another way.”

Plan a specific transfer attempt

Choose a new context that matters to your learning goal. It can remain fictional. Transfer means applying a strategy to a different demand, not only replacing a name on a completed worksheet.

Transfer-plan field	Your plan
Strategy I already practised	
New task and why it is different	

Transfer-plan field	Your plan
Source information or materials required	
Criterion for a useful result	
Agreed tools, supports and observer	
Date or session for the attempt	
Evidence I will keep	
Review: what transferred and what needs more practice?	

Example: After calculating whole packs for a classroom order, use the same checking routine for a new fictional folder request. Twelve learners each need one folder, with two spares. Three folders are available. Packs contain five folders and cost $8.75; delivery is free in this new case, and the budget is $25. The target is fourteen, so eleven more are needed. Three packs cost $26.25, exceeding the budget by $1.25. The successful transfer includes noticing the new delivery condition, rounding the pack count appropriately and reporting the budget gap. Copying the previous case's delivery charge would miss the changed information.

Keep the working and ask someone to check whether the quantities and conditions support the result. Identify any step to revisit. Progress can include catching an error sooner, asking a precise question, explaining clearly or completing a task with fewer prompts.

Source and use note

The nine skills are described in the supplied SkillPlan *Skills for Success Get Started Guide for Practitioners*, revised March 2024, PDF/printed page 11. Its page 19 describes the source guide's preliminary proficiency arrangements; this portfolio does not assign those levels. Learner choice draws on pages 24–25; evidence and feedback on pages 37–38; and practice and reflection on pages 40–42. The glossary, templates, feedback descriptions and example are original materials prepared for community and practitioner review. Community approval is not claimed.
