BOOK 2 · PRACTITIONER GUIDE AND ANSWER COMPANION

Teaching the nine Skills for Success

A complete ACCESS IS4S reworking of the supplied guide: framework, six teaching approaches, nine skills, integrated lessons, assessment and practitioner development.

Reading	Writing	Numeracy
Digital	Problem solving	Communication
Collaboration	Adaptability	Creativity and innovation

Learning, work and community in British Columbia

Original ACCESS IS4S curriculum draft informed by the complete 148-page SkillPlan guide, current federal Skills for Success resources and attributed BC Indigenous education sources.

23 October 2026 · Edition 1 · For instructor review and learner pilot

About this edition

This practitioner companion reworks the instructional scope of the complete 148-page SkillPlan guide in original prose and activities. It includes teaching decisions, complete lesson materials and answer guidance for every learner activity. Source bibliography entries are preserved as an attributed index; outside works are not presented as independently verified unless the research record says so.

The original supplied guide remains in the repository. The practitioner book includes the source crosswalk, reference index and online research record. The books use original practice cases and contemporary BC learning contexts. Nation-specific knowledge and protocols require the direction of the relevant people; this draft does not claim community endorsement or official certification.

Keep your responses in a notebook, accessible digital document or the supplied learning templates. Each numbered activity has companion answer guidance. Reading pages, editable source and both PDF books are available from the repository.

In this book

PRACTITIONER 01
A shared foundation for ACCESS IS4S practice

PRACTITIONER 02
Teaching the nine skills through useful work

PRACTITIONER 03
Teaching Reading: make the search and the reasoning visible

PRACTITIONER 04
Teaching Writing: help a reader understand and act

PRACTITIONER 05
Teaching Numeracy: connect the question, the quantities and the decision

PRACTITIONER 06
Teaching Digital: make useful work that can be found, checked and protected

PRACTITIONER 07
Teaching Problem Solving: investigate before committing to an answer

PRACTITIONER 08
Teaching Communication: build a shared understanding and check it

PRACTITIONER 09
Teaching Collaboration: make participation and coordination observable

PRACTITIONER 10
Teaching Adaptability: preserve the purpose while revising the approach

PRACTITIONER 11
Teaching Creativity and Innovation: develop an idea through use and feedback

PRACTITIONER 12
Three complete lessons for the ACCESS IS4S learning room

PRACTITIONER 13
Develop your practice and improve the program

ANSWERS 01
Answer guidance: Reading

ANSWERS 02
Answer guidance: Writing

ANSWERS 03
Answer guidance • Numeracy

ANSWERS 04
Answer guidance • Digital

ANSWERS 05
Answer guidance • Problem solving

ANSWERS 06
Answer guidance • Communication

ANSWERS 07
Answer guidance · Collaboration

ANSWERS 08
Answer guidance · Adaptability

ANSWERS 09
Answer guidance · Creativity and innovation

ANSWERS 10
Integrated projects — answers and evidence guidance

Original guide bibliography: source index only

A shared foundation for ACCESS IS4S practice

ACCESS IS4S teaching begins with adults who already use knowledge, judgement and skills in their lives. This practitioner guide helps you make that learning visible, teach a useful next step and create another opportunity to practise. A learner may be preparing for a trade, returning to education, changing work, supporting family or strengthening confidence with a particular task. The nine Skills for Success offer a shared language for that work. The learner's purpose gives the language meaning.

This is an independently authored teaching companion informed by SkillPlan's *Skills for Success Get Started Guide for Practitioners*, revised March 2024. It expands the supplied guide into original ACCESS IS4S explanations, classroom cases, teaching decisions and evidence records. SkillPlan is the source guide's author and publisher; the Government of Canada is its identified funder. Our activities are classroom proposals, not SkillPlan lesson reproductions, validated assessments or professional certification.

The learner textbook and this practitioner guide are designed to work together. Learners need clear explanations, useful examples, time to try, feedback and a reason to return to a skill. Practitioners need the reasoning behind those choices, ways to adjust support and a defensible account of what an attempt shows. A completed page is useful when you can explain what the learner did and what they need next.

Who can use this guide

An instructor can use the chapters to plan explicit teaching and observe individual evidence. A curriculum developer can check whether a task, its documents and its success criteria fit together. A program lead can review access, time, materials and opportunities for practice across a cohort. A career or employment practitioner can select a short activity that connects a learner's goal to a concrete next step. A workplace trainer can use the same approach with suitable current documents and appropriate permission.

These roles overlap. An experienced trades instructor may know the occupation well and want a clearer way to teach reading a table. An adult educator may know how to build reading confidence and need help understanding the occupational purpose of a table. Neither needs to know everything before collaborating. Identify whose expertise is needed and keep the learner's task at the centre. SkillPlan's opening pages deliberately address instructors, curriculum developers, instructional designers and program managers, including people new to the framework and practitioners moving from Essential Skills. [S1, pp.3–8]

Use the material in a sequence that fits the learner and the program. The numbered skill chapters make resources easy to find; they do not require every cohort to begin with Reading or to spend equal time on every skill. The existing asphalt A1 unit, for example, begins with Reading, Communication and Collaboration; continues with Numeracy, Digital and Writing; and then emphasizes Problem solving, Adaptability, and Creativity and innovation. That is one teaching sequence for a particular unit, not a national order of acquisition.

Before delivery, choose a manageable purpose. “Use a changed training notice correctly” supports a clearer session than “improve employability.” Agree the materials, target skill, supports, evidence and next opportunity. Leave enough time to teach and revisit a strategy. An activity that rushes through nine labels can leave less learning than one task with two explicitly taught skills.

What the nine skills describe

The Skills for Success framework, launched in 2021, describes foundational skills used in work, learning and life. The skills overlap and interact with technical knowledge and other experience. They are not a list of occupations, a personality inventory or an ordered ranking of people. SkillPlan explains this relationship and the expanded model on pp.10–11. The short descriptions below are our paraphrases for planning instruction. [S1, pp.10–11]

Skill	Useful instructional question	Evidence you could observe
Reading	What information is needed, and what does the document actually support?	A learner locates a condition, relates it to another detail and explains the action it requires.
Writing	What does this reader need to understand or do?	A learner produces a clear message, checks its information and revises it for the reader.
Numeracy	Which quantities matter, what calculation fits, and does the result make sense?	A learner identifies units, calculates, checks and interprets a result.
Digital	Which device or tool helps complete the task, and how will the information be managed?	A learner enters information, uses a suitable tool, checks the output and saves or shares it appropriately.
Problem solving	What is the issue, what evidence is available, and which response is justified?	A learner compares options, explains a choice and checks whether it addresses the issue.
Communicati on	How will we understand one another and confirm the message?	A learner listens or receives a message, asks a useful question, explains and checks understanding.
Collaboration	How will people contribute to a shared purpose?	A learner takes a role, considers another contribution and helps the group reach a decision.
Adaptability	What has changed, and how should the goal or approach change?	A learner identifies a changed requirement, adjusts a plan and uses feedback.
Creativity and innovation	What different approach could work, and how can we test and improve it?	A learner generates alternatives, develops one and improves it after a trial.

These examples cover selected actions. Each skill has a fuller component structure explored in its chapter. A digital file exercise does not cover every aspect of Digital; a friendly conversation does not establish every Communication component. Choose the components that the activity actually makes observable. Record other skills as supporting demands unless you also teach and assess them.

Consider a learner checking a revised session notice. Reading helps locate the new time and compare versions. Numeracy may help calculate a journey duration. Digital may help retrieve the latest file. Communication helps clarify an unresolved detail. Adaptability helps revise the plan. You can recognize the whole task while focusing

the observation on whether the learner used the correct version. The framework gives a way to distinguish evidence within integrated work.

Preserve useful Essential Skills work and update its purpose

The older Essential Skills framework supported occupational profiles, document-based teaching and task complexity. SkillPlan traces that history on pp.12–16. Existing materials can still contain useful notices, forms, diagrams and questions. A transition requires more than replacing the old title with the new one. Check what the learner actually does, whether the document is current and how the task relates to the expanded skill components. [S1, pp.12–18]

Earlier Essential Skills label	Planning implications in Skills for Success
Reading	Retain useful comprehension work; include the document forms and evaluation demands of the current Reading task.
Document Use	Identify its Reading, Writing or Numeracy actions. Locating a table entry, entering information in a form and calculating from a chart need different evidence.
Writing	Preserve a real reader and purpose; teach planning, drafting and revision alongside accurate information.
Numeracy	Connect mathematical information, calculation, interpretation and communication; retain the document context.
Computer Use / Digital Technology	Consider the broader range of devices, tools, information and platforms relevant to the actual task.
Thinking Skills	Revisit the activity through Problem solving, with an identifiable issue, relevant evidence and a reasoned response.
Oral Communication	Review the broader Communication demands, including how people receive meaning and interact.
Working with Others	Make shared goals, contribution, inclusion and respect for difference explicit within Collaboration.
Continuous Learning	Examine relevant Adaptability actions and learning across all skills; a completed course alone does not demonstrate adaptability.
No separate earlier label	Add explicit opportunities for Creativity and innovation rather than assuming an open-ended assignment teaches it.

This table paraphrases SkillPlan’s transition discussion; it is a curriculum planning aid, not a score conversion. Document Use has been embedded in Reading, Writing and Numeracy, not discarded. Keep its useful work visible. For example, on one practice form a learner might read the required fields, calculate a total and write a concise explanation. Observe each action separately if all three are learning outcomes. [S1, pp.17–18]

The supplied paper-plane lesson illustrates an opportunity to update older material. It names earlier Essential Skills and asks learners to reflect on their use. To develop a current lesson, first check what the available pages actually contain. A folding document mentioned in a lesson is not available evidence if it was not supplied.

Provide an accessible current instruction sheet before asking learners to interpret it. Teach a check-back routine before observing Communication. Set shared roles and an individual reflection before claiming Collaboration. Add a deliberate change and a revised plan only if Adaptability is a genuine objective.

Do not attach all nine labels to the plane activity simply because people read, talk and move. A measurement task requires a defined quantity, consistent method and a purpose. A writing outcome requires learner-authored text. A Digital outcome requires an individual interaction with a digital tool. A creative outcome needs an opportunity to generate and develop an idea. This approach preserves useful teaching while making the new claims more precise.

Use complexity and proficiency carefully

A skill can be used in straightforward or demanding circumstances. A task may become harder when relevant information is spread across documents, competing details must be rejected, the purpose is unfamiliar or the learner must justify an inference. Adding more questions does not necessarily change the kind of thinking required. Support conditions also matter: a correct answer after a full demonstration is different evidence from an independent attempt on a new document.

SkillPlan's March 2024 guide describes its Skills for Success proficiency descriptors as preliminary. It presents Levels 1–5 for Reading, Writing and Numeracy and Entry, Intermediate and Advanced for the other six skills, and explains that further refinement is needed. Its discussion of legacy survey scales and Essential Skills levels on pp.13–16 is historical framework context. This edition does not turn those descriptions into a test or assign a learner a national level from our activities. Consult current official descriptions and the terms of any selected assessment before using formal classifications. [S1, pp.13–19]

Avoid repeating the guide's historical population statistics as present-day facts about a cohort or an individual. A learner's language history, disability, attendance, age or Indigenous identity cannot establish a proficiency level. One reading difficulty also cannot establish general judgement, collaboration or ability to learn. Describe the task and the observation rather than attaching a broad label to the person.

For classroom feedback, use four local statuses:

Status	Meaning in this resource
Not observed	There was no adequate opportunity or evidence to judge this criterion. Arrange another opportunity.
Not yet demonstrated	An opportunity was available, but the evidence did not yet meet the stated criterion. Identify a teaching response.
Demonstrated with support	The criterion was met with a recorded prompt, model, assistance or agreed support. State what support mattered.
Demonstrated independently	The criterion was met under the agreed conditions without task-specific prompting. Record the task and tools.

These are teaching notes, not official proficiency bands. An agreed accessibility tool can be part of the independent task conditions; using it does not automatically mean task-specific assistance. Explain the conditions before the attempt and record them consistently. A learner who independently uses an agreed

calculator is different from a learner whose partner chooses and enters every operation.

Record transfer separately: “Used the version-checking strategy on a different notice one week later.” A familiar classroom attempt does not establish workplace transfer. An independently completed simulation does not establish competence to operate equipment, meet a regulated requirement or perform an employer’s procedure. Foundational skill evidence and technical qualification serve different purposes.

Plan for BC Indigenous adults through relationship and choice

A shared ACCESS setting does not mean shared histories, identities, languages, cultural practices or goals. Urban Indigenous learners may have relationships with many places and communities. People may be connected to a Nation, exploring connections, maintaining family responsibilities, living away from home or choosing not to discuss identity in class. The practitioner does not need disclosure to provide respectful teaching.

Verified BC sources help ground this approach. Douglas College’s Indigenous Student Services describes support for self-directed independent learners and welcomes mature, returning and new students. JIBC’s engagement guidance recognizes distinct First Nations, Inuit and Métis identities, migration and urbanization, and the right of people and communities to determine how they participate. These are sources for our design choices, not a claim that those institutions set ACCESS policy. [S2; S3, printed pp.12–17 / PDF pp.7–9]

Begin with an invitation: “Choose an example that matters to you, or use the fictional case.” Offer meaningful choices in context and access while keeping the learning outcome clear. A learner can practise reading with a training notice instead of a personal letter. A writing task can use a fictional appointment instead of a real medical record. Someone can contribute a practical strategy without explaining its family or cultural origin.

Respectful local engagement is more than inserting a story or image. An ACCESS lead should establish who has authority for the proposed contribution, whether participation is wanted, the scope of use, attribution, review and compensation. BCIT’s Protocol Welcome guidance distinguishes a host-Nation welcome from acknowledgement and emphasizes that practices differ. Do not script a welcome for an instructor to perform, copy a campus territorial statement into another location, or present a generic ceremony as a learning technique. [S4]

There is also a directly relevant professional-learning resource. Douglas’s *Indigenous Skills for Success Journey, Planting the Seeds for Growth* is designed for practitioners supporting Indigenous learners. Its facilitator guide acknowledges an ACCESS advisory contribution and dedicates the project to former ACCESS CEO John Webster. This establishes a documented connection to that project, not endorsement of our textbook. Link to the original course and respect its CC BY-NC-ND licence; do not reconstruct its stories, artwork or activities here. [S5, printed pp.1, 4–10 / PDF pp.2, 5–11]

Assess learning actions rather than conformity to one interaction style. A learner can show that they understood by giving an accurate check-back and asking a relevant question. Accent, rapid speech, eye contact or ease with public disclosure are not the success criteria. Collaboration can be visible in a careful question, a useful written contribution or attention to a partner’s idea. Teach respectful disagreement through evidence and agreed purpose; quiet participation needs an appropriate observation opportunity.

Establish the teaching agreement

Before the first activity, explain what the program will ask learners to do, how feedback works and how to ask for support. Confirm the real program procedures for information storage and sharing; do not promise confidentiality beyond those arrangements. Keep records limited to the learning purpose. Cultural identity, family history and diagnoses are not routine evidence for a skill judgement.

Set a practical agreement with the group: listen for meaning, ask when information is unclear, make space for others, use the fictional case when preferred and review how the group is working. Allow time to think before responding. A group agreement should help people participate; it should not require personal storytelling or agreement with every view. Respond to harmful conduct through the program's actual procedures, rather than expecting a learner to practise adaptability by accepting it.

Make the path visible: explanation, model, supported practice, individual attempt, feedback and another opportunity. Tell learners what counts as a successful attempt and show an example. Let them help select a next goal. Instructors and learners can both ask, "What evidence do we have, what helped, and what should we try next?" The following chapter develops the six teaching approaches that turn these commitments into a usable session.

Sources and reading directions

S1. SkillPlan. *Skills for Success Get Started Guide for Practitioners*, revised March 2024, supplied source, pp.3–22. Printed and PDF page numbers agree. Pages 20–22 introduce SRDC reports, the practitioner competency framework, Essential Skills Profiles, the Reader's Guide and *Controlling Complexity*. They are reference leads here; citing SkillPlan's descriptions does not mean those works were independently read. The source's page 11 attributes the nine formal definitions to Government of Canada.

S2. Douglas College. Indigenous Student Services, retrieved 23 October 2026. Institutional service descriptions support the examples of learner agency and individualized support; availability and eligibility are Douglas-specific.

S3. Justice Institute of British Columbia. *Living Indigenization: Engagement Protocols & Guidelines*, ©2025; content credited to Heather Saranczak and Jason La Rochelle; retrieved 23 October 2026. Cited pages are concise paraphrases. The PDF and artwork are not reproduced in this resource.

S4. BCIT. Protocol Welcome and Land Acknowledgement, retrieved 23 October 2026. Guidance is institutional and location-specific; confirm local relationships and arrangements.

S5. Douglas College. Indigenous Skills for Success Journey and Facilitation Guide, retrieved 23 October 2026. The guide's printed p1 / PDF p2 specifies CC BY-NC-ND 4.0; this chapter links and paraphrases selected front matter, not the course activities.

Teaching the nine skills through useful work

This chapter turns the six overarching approaches in SkillPlan's guide into decisions an ACCESS IS4S practitioner can make before, during and after a session. The approaches work together. A relevant task can still be inaccessible; a welcoming conversation can still leave the skill unexplained; a polished group product can still hide one person's learning. Plan the task, the teaching and the evidence together.

The examples below are original classroom simulations. They can be used in an asphalt preparation cohort, another trades pathway or a broader employment and community learning program. They do not establish an employer's procedures or a Nation's protocols. Local partners and learners help determine which examples matter, and a learner can use the supplied case without sharing a personal experience.

1. Begin with the learner's purpose and existing knowledge

A useful first meeting is a conversation about a goal, a task and a workable next step. It need not begin with a test or a request to describe everything that has been difficult. Someone who has managed a household budget, repaired equipment, cared for relatives, organized travel or learned a new language brings knowledge to the room. The practitioner still needs evidence of the particular skill being taught; recognizing experience does not mean assuming a skill is already demonstrated.

Invite the learner to choose a practical goal. “I want to understand a training schedule without missing a change” is specific enough to plan instruction. “I want to improve all my skills” can be narrowed by asking which situation would make the next week easier. Offer examples when a learner is uncertain. A person does not need a settled career plan to take part.

Explain what information will be recorded, why it is useful and who normally sees it under the program's actual procedures. Ask about supports privately. A learner can request larger print or a quieter place without giving the class a diagnosis. An Indigenous learner is not required to name a Nation, discuss family history, explain a ceremony or become the class's cultural resource. Invite knowledge; do not make disclosure the price of participation.

A ten-minute starting conversation

Prompt	What the practitioner listens for	Possible next action
What would you like to be able to do more easily?	A task or purpose chosen by the learner.	Select a relevant chapter activity together.
Where have you done something similar?	Existing strategies and experience, including outside paid work.	Ask whether the learner wants to demonstrate a strategy.

Prompt	What the practitioner listens for	Possible next action
Would you rather begin with this notice, this table or a short conversation?	A workable entry point, not a permanent learning-style label.	Offer a brief task in the selected format.
What would make this easier to access?	Print, language, device, pace, communication or environmental supports.	Arrange a specific support and record only what is necessary.
What should we look at again after practice?	A shared success criterion.	Set a review point and retain the first attempt if the learner agrees.

This conversation provides starting information, not a diagnosis. Avoid turning a preference into a fixed category such as “visual learner.” Someone may prefer a diagram for equipment parts and an oral explanation for an unfamiliar form. Ask what helps for this task, then check whether the support actually helps.

Make choice real without removing the outcome

Suppose the outcome is to identify the date, location and required action in a notice. Offer the same notice in large print, accessible electronic text and a normal print copy. A learner may use text-to-speech; record that support. If the outcome is independent reading without an audio support, that different condition needs its own observation. The accessible attempt remains useful evidence of supported comprehension.

For a writing task, a keyboard, speech-to-text or a scribe can preserve learner authorship when the learner chooses the wording and revises the text. A conversation about what someone might write is preparation, not the final writing product. For a listening task, requiring a long written report may introduce a writing demand that obscures comprehension. Ask for a spoken, signed, AAC or other accessible check-back that lets the learner show the intended communication action.

Choice also concerns subject matter. A learner may use the fictional training-room notice rather than a real medical appointment or family message. The skill demand can remain comparable while the personal exposure changes. This is a practical way to respect boundaries without lowering the expectation that the learner locate, interpret and use the information.

Build a small individual learning plan

Use a plan that can be read during a conversation rather than filed away after intake. A completed example might say: “Goal: check a changed session time. Starting evidence: found the room and date; used the old time after reading a correction. Support: two versions displayed side by side. Teaching: compare version labels before answering. Next attempt: another notice with one changed field. Review: next session.” This is more useful than “weak reading” because another practitioner can act on it.

The learner's goal can change. Record the change and its reason without treating it as failure. A person may discover that digital file organization matters more immediately than a longer report. Keep the agreed pathway visible, with opportunities to return to earlier goals. Learning ownership is supported by clear choices and dependable follow-through, not by leaving someone alone with an unfamiliar task.

2. Choose a context that makes the skill necessary

Contextualized teaching connects a skill to a purpose the learner can recognize. The document, decision and consequence should fit together. A fabricated pay table used to practise arithmetic is a simulation. A current employer-issued record used with permission is an authentic workplace document. Both can support learning, but label them accurately and choose them for different reasons.

Start with a task sentence: “A new crew member needs to know where to report and whom to contact if the information conflicts.” Identify the documents the person would actually consult. Then identify what the learner must do with them: locate a name, compare two dates, recognize a missing approval, calculate a total or ask a clarification question. These actions determine the teaching. A decorative photograph of a construction site does not by itself make an unrelated worksheet occupationally relevant.

For asphalt preparation, the supplied A1 outline provides a useful content boundary: introduce the industry, equipment purposes, resources, users and project information. The nine foundational skills help learners understand and communicate that content. An equipment-name matching activity does not demonstrate machine operation. A fictional project budget does not establish the real cost of a paving job. State the boundary where it affects what the learner may conclude.

Build a document set from a real task

Use the following sequence when creating or selecting materials:

1. Name the person who needs the information and the decision they must make.
2. Identify the relevant document type: notice, schedule, label, form, table, drawing, message or procedure.
3. Check the document's source, date, version, scope and intended users.
4. Check whether personal or organizational information must be removed and whether classroom use is authorized.
5. Identify the exact reading, writing, mathematical, digital or interaction demand.
6. Prepare a simpler entry version if needed, preserving the meaning of the task and marking alterations.
7. Create a new but comparable task for a later independent attempt.

To find suitable documents, begin with people and organizations responsible for the work. A subject-matter expert or employer can identify the forms, schedules and instructions actually used in a task. Regulators and government agencies provide current requirements within their authority; industry associations, trade publications and public company resources offer other useful examples. Academic partners and established training networks may help locate material or arrange a practitioner conversation. Check the source and version rather than assuming that a familiar logo makes a document current. Agree permission, removal of private information, attribution and classroom use before adapting material. A professional forum or social post can supply a lead, but trace a claim to the responsible source before teaching it as a requirement. These routes adapt the practical collection guidance on source page 28.

Do not remove a key condition merely to make a task easier. If a schedule says “arrival at 8:45; instruction starts at 9:00,” simplifying it to a single time removes the distinction the learner may need to understand. Instead, highlight the two labels and model how to explain their relationship.

A complete practice document: two versions of a notice

> **Fictional training notice — version 1, issued Monday**
>
> The classroom materials session is on Wednesday in Room 3. Arrive at 8:45 a.m. Instruction begins at 9:00 a.m. and finishes at 11:30 a.m. Bring your workbook and a pencil. If travel arrangements affect your arrival, contact the training coordinator before the session. No equipment operation is scheduled.
>
> **Fictional correction — version 2, issued Tuesday**
>
> Wednesday's materials session will use Room 5. Arrival and instruction times are unchanged. The coordinator will place a printed correction at the original room. Use version 2 for the room information. If you cannot confirm which notice is current, ask the coordinator before making a new arrangement.

This short set supports several distinct outcomes. Reading: identify what changed and what stayed the same. Numeracy: distinguish the 15-minute arrival interval from the 150-minute instruction period. Writing: prepare a concise correction for a classmate. Communication: check that the classmate understands the new room. Digital: save the two files with meaningful version names, if actual device use is part of the activity. Problem solving: decide what to do when only an undated screenshot is available.

The same set does not automatically demonstrate all nine skills. Collaboration would require a shared goal and observable contributions. Adaptability would require a first plan and an adjustment. Creativity and innovation would require developing and trying an improvement. Add those actions deliberately when they are intended outcomes; otherwise keep the lesson focused.

Make B.C. and community context specific without inventing culture

Travel distances, winter daylight, a ferry connection, an urban bus route or a shared device can be relevant to B.C. learners. Use an accurate current source for a real service, or label the timetable as fictional. Do not assume that every Indigenous learner lives remotely or that every learner in a city has reliable transport. Ask which conditions matter in the cohort and provide an alternate case.

A community event can be a useful context for scheduling, budgeting and communication. The class can plan an ordinary open learning session using supplied information. It should not invent the protocol for a ceremony, assign cultural roles or use a Nation's name as a fictional setting. If a local partner contributes a real example, agree on the purpose, the material that may be shared, attribution, review and future reuse. Record the decision as a specific agreement, not a general claim that the curriculum is community approved.

When learners choose to contribute examples, ask whether they want the example discussed, recorded, adapted or only heard in that moment. These are different decisions. An oral contribution is not automatically permission to publish a story in a workbook. A learner may withdraw an example from further classroom use while continuing with the supplied case.

3. Change complexity deliberately

Difficulty can come from unfamiliar vocabulary, the number of documents, the need to infer, competing information, the number of calculation steps, tool demands, time pressure or the consequences of an error. Changing several at once makes it hard to discover why a learner struggled. Begin by identifying the demand

you intend to teach.

Use starting evidence rather than a general impression. A learner who finds a number in a table may still need help deciding what that number represents. Another learner may understand the reasoning but have difficulty navigating the spreadsheet. Those learners need different next steps. Neither observation supports a broad claim about intelligence or readiness for every task in an occupation.

The following progression uses the notice set above. These are local teaching stages, not official proficiency levels.

Stage	Task	What changes	Useful support
Locate	Find the instruction start time in version 1.	One explicit fact in one short document.	Highlight the label “instruction begins.”
Connect	Explain why arrival and instruction have different times.	Relate two facts and their purposes.	Mark both phrases; draw a short timeline.
Compare	Identify the changed room using both versions.	Use two documents and version information.	Place the notices side by side.
Evaluate	Decide whether an undated screenshot is sufficient.	Judge source adequacy and identify missing information.	Use a source-check question list.
Transfer	Use a new notice with a changed date and a different layout.	Apply the strategy beyond the first example.	Agree in advance which supports remain available.

Increase challenge after the learner can explain a strategy and use it with reasonable consistency. One correct answer may result from guessing or remembering the demonstration. Ask for a comparable new attempt and a short explanation. Repetition should strengthen a useful action, not simply repeat the same answer.

Separate support from task demand

A scaffold is a temporary aid that makes a strategy visible: a labelled example, a partial table, a vocabulary list, a sentence starter or a worked first step. A calculator can be an ongoing work tool rather than something that must always be removed. Decide whether the assessment concerns mental calculation, tool-supported calculation or mathematical interpretation. Record the actual condition.

When reducing a scaffold, explain the change. “This time the headings are not highlighted; show me how you choose the useful one” makes the learning purpose visible. Removing every support without notice may reveal the effect of surprise more than the intended skill. Conversely, leaving a completed model beside an identical question may hide whether the learner can select the method independently.

Do not claim that a shortened text is automatically easy or that a longer text is automatically difficult. A two-sentence message with an implied deadline can demand more inference than a long, clearly structured notice. A large table with obvious labels can be easier to use than a small table with ambiguous units. Review the relationship among the question, the document and the required operation.

Diagnose an error before changing the lesson

Suppose a learner answers that the training session lasts 165 minutes. That value describes 8:45 to 11:30, the arrival-to-finish interval. The arithmetic may be correct while the selected start time is wrong for the question. First ask the learner to point to the start label they used. Teach the distinction between arrival and instruction, then ask for the instruction duration again. Re-teaching subtraction alone would miss the problem.

For a different learner, the correct times may be selected but 9:00 to 11:30 may be reported as 230 minutes. Model hours and minutes as different units: two hours are 120 minutes; add 30 to obtain 150. Ask the learner to check whether 230 minutes is plausible for an interval shorter than three hours. These different responses call for different feedback even though both final answers were incorrect.

Record the teaching decision: “Selected arrival rather than instruction start; used heading comparison” or “Selected correct times; needs hours-to-minutes conversion.” This gives the next practitioner useful information and lets the learner see a specific, manageable next step.

4. Make the strategy visible through direct instruction

Direct instruction is an explanation and demonstration of a usable process, followed by practice and feedback. It does not require the practitioner to speak for the whole session. A short, clear model can give learners more time to make choices, try an approach and discuss what happened.

Name the outcome before the demonstration. “Today we will check a change notice and explain the current arrangement” is more useful than “Today we are doing Reading.” Identify a small number of success criteria. In the notice example, the learner should name the current room, retain the unchanged start time, identify which version supports the answer and state what to do if the version cannot be confirmed.

Model the decisions as well as the answer. Point to a heading, explain why it matters, reject an irrelevant number and check the result. Include a plausible error and show how to recover from it. This makes checking a normal part of competent work rather than a response reserved for someone who is struggling.

A worked practitioner demonstration

The practitioner displays both notices and says:

> “The question asks where to go on Wednesday. I see two room numbers, so I should not choose the first one I notice. I check the version information. Version 2 was issued later and says the room has changed to Room 5. It also says the times are unchanged. I can answer: arrive at Room 5 at 8:45 for instruction at 9:00. My answer uses the correction for the room and the first notice for the times. If I had only the undated screenshot, I would ask the coordinator which version is current.”

Pause after each decision. Ask a learner to identify the evidence rather than repeat the entire speech. Then cover the answer and give a similar notice about a different room. The demonstration taught a method; the new example reveals whether the learner can use it.

Plan the release of responsibility

Phase	Practitioner does	Learner does	Evidence worth keeping
Show	Models a question, source choice, action and check.	Follows the reasoning and asks a clarification.	A question showing which step is unclear.
Work together	Prompts one decision at a time and checks understanding.	Chooses a heading, operation or message with support.	The particular prompt that helped.
Try with a partner	Gives roles and observes both contributions.	Takes a turn, checks a partner's reasoning and keeps an individual response.	Each person's action, not only the shared sheet.
Try independently	Provides a comparable new task and agreed supports.	Selects and applies the process.	An individual attempt under recorded conditions.
Revisit	Gives specific feedback and another opportunity.	Makes an improvement and explains what changed.	The before-and-after work and next goal.

The sequence can move backward when needed. Returning to a model is a teaching response, not a penalty. It can also move forward more quickly when the learner demonstrates the strategy. Do not require a person to complete unnecessary repetition merely because every worksheet was printed.

Use prompts that preserve thinking. “What does that column count?” invites interpretation. “Write 24” supplies the answer. If a learner needs the second kind of help during instruction, provide it openly and record the supported condition. For an independent check, change the values or document enough that copying the earlier response cannot substitute for the skill.

Explain technical language in use

Introduce a term when it helps solve the task. In an asphalt example, distinguish an aggregate from the asphalt mixture before asking learners to explain the material flow. Ask learners to use the term in a sentence or match it to a purpose. A long glossary handed out before any context may create an unnecessary memory demand.

Use plain language without removing technical accuracy. A definition such as “a paver receives and places the mixture” introduces purpose. It does not teach operating settings. Point to the appropriate technical instructor or current approved document when a learner asks about an operational decision. Showing where the boundary lies is part of responsible document use.

When modelling communication, make the interaction visible. Demonstrate a check-back with another adult or use a short supplied script. Show an incomplete exchange, then improve it by clarifying the action and deadline. Ask learners what changed in the message and what changed in the interaction. This provides concrete teaching for Communication and Collaboration rather than assuming they will develop simply because people sit together.

5. Collect evidence that can guide the next lesson

Assessment should answer a useful question: what can this learner do under these conditions, and what teaching or practice should follow? It should not turn a short activity into a judgment about the person. Decide what evidence would support the intended claim before choosing an assessment format.

A starting task helps select instruction. Formative checks guide teaching while learning is underway. An end-of-unit task shows performance against the unit's stated outcomes. A later unfamiliar task can provide evidence of transfer. These purposes overlap, but the conclusions differ. Completing the same worksheet twice may show recall and improved familiarity; it does not automatically establish general transfer or a validated skill-level gain.

Use comparable conditions when interpreting change. Record task version, support, time conditions and response mode. If the second attempt is easier, or the learner receives more help, explain that difference. Improvement can still be meaningful, but a score alone will not tell the whole story. For formal program reporting, follow the program's approved assessment method rather than treating this book's observation descriptions as a standardized scale.

Four local evidence descriptions

Description	Meaning in this curriculum	Example
Not observed	The necessary evidence has not been collected.	No device turn occurred, so saving and reopening a file was not observed.
Not yet demonstrated	An observed attempt does not yet meet the stated task criterion.	The learner selected an outdated notice after comparing both versions.
Demonstrated with support	The criterion was met using identified assistance.	The learner found the current notice after a prompt to compare version dates.
Demonstrated independently	The criterion was met independently under the recorded conditions.	The learner selected the correct notice and explained the version evidence without prompting.

These descriptions are local teaching language. They are not the federal framework's proficiency levels, a trade grade or a permanent learner label. A person may demonstrate a calculation independently and need support interpreting its context. Record the two observations separately.

A usable observation record

Field	Completed classroom example
Learning ID and date	Practice learner L 04; session date recorded locally.
Task and version	Training notice, versions 1 and 2; changed room.
Focus skill and criterion	Reading: connect the correction to the unchanged time information.
Evidence	Named Room 5; retained 8:45 arrival and 9:00 instruction; pointed to both notices.

Field	Completed classroom example
Support	Printed notices side by side; no verbal prompt during the final attempt.
Feedback description	Demonstrated independently under these conditions.
Feedback	“You checked the version and used both documents. Next, try a notice with a changed date.”
Next attempt	New event notice in another layout, with a date change.
Transfer note	Planned; no later unfamiliar-task evidence collected yet.

Avoid entries such as “good attitude,” “not motivated” or “naturally weak with numbers.” They do not identify the skill, the conditions or a teachable next step. If participation is interrupted, record the interruption separately and arrange another opportunity. A missed observation is not the same as an unsuccessful attempt.

Check validity, fairness and consistency

A task is useful when the evidence matches the intended claim. If Reading is the focus, a difficult login should not decide the result. If Writing is the focus, a partner's polished paragraph should not be attributed to the learner. If Collaboration is the focus, observe how contributions are invited, negotiated and combined. The finished poster alone cannot show those interactions.

A fair process provides access to the task while keeping the intended skill visible. Offer appropriate supports, explain the criteria and allow a way to raise a concern. Check whether unfamiliar cultural assumptions or personal disclosure requirements are affecting the task unnecessarily. If the question depends on knowing a particular event or family arrangement, provide that information in the case or offer a comparable alternative.

For consistent interpretation, practitioners can review two anonymized samples together. Each identifies the criterion, evidence, support and proposed feedback before comparing judgments. Discuss disagreements by returning to the task and the evidence. This is a moderation conversation, not a contest to see whose first impression was correct. Keep a short agreed example of what meets the criterion with and without support.

Give feedback the learner can use

Useful feedback identifies a successful action, a specific issue and a next attempt. “You used the correct rows and labelled the total in dollars. The percentage used the other group as the whole. Show me the complete group first, then try the fraction again” provides direction. “Try harder” does not.

Do not overload the learner with every possible correction. For a short project note, first address a wrong date or an unclear action that could mislead the reader. Then choose one language improvement that helps meaning. A later task can focus on a different writing feature. Explain the priority so the learner understands that other features have not simply been ignored.

Invite the learner's interpretation: “What did you intend here?” or “Which check would help you catch this next time?” The learner may reveal a reasonable method, a misunderstood instruction or a missing piece of source information. Revise the teaching decision when the evidence warrants it.

Evaluate the program without overstating results

A pilot can reveal unclear prompts, inaccessible files, timing problems and useful learning strategies. It cannot by itself prove that the curriculum causes employment outcomes. Report what was measured: attendance opportunities, completed task attempts, documented changes under comparable conditions, learner feedback and later transfer observations where available.

A small feedback form can ask whether the task purpose was clear, which support was useful, what still needs explanation and what the learner would change. Provide an anonymous or private route where practical. Do not make praise a condition of a supportive relationship. Include critical feedback in the revision record and explain what will change.

If a program collects employment or further-training outcomes, distinguish those outcomes from skill observations and record the time period and collection method. Many factors influence work and education pathways. A claim that everyone improved or that a book guarantees readiness requires evidence this draft does not supply.

6. Teach social and emotional skills as actions

Problem Solving, Communication, Collaboration, Adaptability, and Creativity and Innovation are taught throughout this curriculum. They are also given their own chapters because naming a skill during a group exercise is not enough. Learners need examples, a process to try, feedback and another opportunity.

Assess actions that can be observed or explained. A learner can identify a change, decide what to preserve, ask for support and revise a plan. Those actions provide evidence of Adaptability. The practitioner does not need to infer whether the learner felt calm. A learner can disagree respectfully, explain the evidence and propose a next step. That can support Collaboration even when the learner does not adopt the first suggestion offered.

Do not equate these skills with compliance. Appropriate persistence includes deciding when to seek help, change an approach or stop an unsafe or unsuitable task. Responsibility includes communicating a limit and arranging a handover. A request for a break or clarification can be part of an effective strategy. The criterion is the task-relevant action and its consequences, not whether the learner looks cheerful or performs a preferred personality style.

Teach a response to a low-stakes change

Use a classroom information sheet rather than a surprise involving a learner's real employment or personal life. First explain the task and allow a draft. Then introduce a modest change: the visitor has less reading time, the printout will be black and white, or a room is unavailable. Make the change understandable and provide time to respond.

Model a routine: pause; name what changed; identify what must remain; generate options; choose a next step; check the revised result. Ask the learner which strategy helped. Keep the first draft, the change note and the revision. These provide better evidence than a practitioner's impression that someone “handled change well.”

Do not create distress to test emotional regulation. Skills practice is not therapy or a crisis simulation. If a learner is affected by the activity, offer an alternative and use the program's established support procedures where needed. The practitioner can support learning without asking for the history behind a response.

Make teamwork teachable

Before a paired task, state the common goal and show what useful interaction looks like. For a checked table, one learner may explain the selected row while the other checks units and asks a clarification. Swap roles so both use the skill. Roles should create access to participation, not permanently assign one person as the expert and another as the recorder.

Teach a disagreement routine using a harmless document question: each person states their interpretation; the other restates it; both point to the evidence; the pair identifies agreement, uncertainty and a next step. If the document is ambiguous, the appropriate result may be a question for the coordinator rather than a forced consensus.

Observe the interaction. Did the learner make a contribution, consider the other person's information, ask a useful question and help reach a shared next action? Did each have an opportunity to use the tool or explain a decision? Record a concrete example. A group can produce an incorrect answer while showing a useful collaborative process, and a correct answer can be produced through an unfair process. Teach and assess both dimensions deliberately.

Use reflection without demanding personal disclosure

Reflection can be brief and practical: “Which information changed your decision?” “What did your partner help you notice?” “What will you check first next time?” Learners may answer through a chosen accessible mode. A written emotional history is not necessary to demonstrate a task strategy.

A learner's explanation is valuable evidence, but distinguish a stated intention from an observed action. “I will use a checklist at work” is a transfer plan. A later example showing the checklist used on an unfamiliar task provides additional evidence. Recognize both without treating them as identical.

Avoid fixed labels in feedback. Say, “You tried two layouts and tested them with a reader” rather than “You are a creative type.” Say, “You noticed the missing source and asked before using the number” rather than “You are naturally careful.” Action-focused language helps the learner identify a strategy that can be used again.

Bring the six approaches into one session

The following plan is a complete 45-minute example using the two fictional notices in this chapter. It can introduce a longer learning sequence. Its timing is a proposed classroom design, not an official Skills for Success allocation.

Minutes	Teaching action	Evidence
0–5	Invite a useful purpose for reading a changed notice; offer the supplied example. State criteria and access options.	Chosen purpose and agreed supports.
5–12	Model version checking and connecting room/time information.	Learner identifies the evidence used in one step.
12–20	Guide practice with both notices; ask each learner to explain one unchanged and one changed detail.	Supported response and the prompt needed.

Minutes	Teaching action	Evidence
20–30	Pairs prepare and check a two-sentence correction; swap speaker/listener roles.	Individual check-back and shared corrected message.
30–40	Give the independent notice pair below, with a changed date; collect an individual response under agreed conditions.	Current date selected, source identified and uncertainty handled.
40–45	Give specific feedback; ask for a next practice choice and record a recheck.	Feedback, learner goal and next attempt.

The six intervals total 45 minutes. The session is learner-centred through purpose and choice, contextualized through a useful document, controlled in complexity through one change at a time, explicit through modelling, assessed through individual evidence, and socially supported through taught check-back and shared work. These are planning decisions the practitioner can explain and revise.

Independent notice pair for minutes 30–40

> **Fictional practice notice A — issued 1 May**
>
> The classroom resource session is on 14 May in Room 4. Arrive at 8:30 a.m. Instruction runs from 8:45 a.m. to 10:15 a.m. Bring a workbook and pen. This is an indoor classroom session. Ask the training coordinator if you cannot confirm the current arrangement.
>
> **Fictional correction B — issued 2 May**
>
> The resource session described in notice A has moved from 14 May to 21 May. Room 4, arrival time, instruction times and materials are unchanged. Use this correction for the date. The dates are invented practice values, not an actual booking.

Ask each learner to identify the current date, room, arrival time and instruction period; point to the source for each; and explain what they would do if they had only an undated screenshot showing 14 May. A brief spoken, signed, AAC or written response can carry the explanation under the agreed assessment conditions.

Answer guidance: 21 May, Room 4, arrival at 8:30 a.m., instruction from 8:45 to 10:15 a.m. Correction B establishes the date and preserves the other details from notice A. An undated screenshot alone does not establish the current arrangement; check the current notice with the coordinator. Record any prompt needed. A learner who gives the right date but cannot connect the unchanged details may need another cross-document reading example.

A reusable planning page

Before teaching, complete these fields in ordinary sentences: learner purpose; document and source status; focus component; observable outcome; model; guided attempt; independent attempt; supports; likely misconception; feedback; next task. After teaching, add actual timing, evidence gaps and one change for the next delivery.

For example, an observation that “four learners could find the updated room but could not explain the unchanged time” suggests returning to cross-document connections. It does not justify repeating the same room-number question for the whole group. A finding that only one device was available suggests a scheduling change before interpreting Digital results. Practical revision connects the program's conditions to the evidence it is able to collect.

Source connection

This chapter reworks the instructional content of SkillPlan's *Skills for Success Get Started Guide for Practitioners* (March 2024), pp.24–43: learner-centred teaching 24–25; contextualization 26–31; complexity 32–34; direct instruction 35–36; assessment 37–39; and social-emotional teaching 40–43. The original's broad effectiveness claims are not presented here as findings from an ACCESS pilot. Its cited third-party studies remain references in that supplied guide unless separately reviewed in the research ledger.

Current federal definitions and component guidance were also checked on the Skills, components and proficiency levels page, accessed 23 October 2026. Local observation descriptions in this chapter are deliberately distinct from federal proficiency descriptors. B.C. source findings and their applicability limits are recorded in the companion research notes.

Teaching Reading: make the search and the reasoning visible

Reading instruction begins with a reason to use a document. An adult may understand a paragraph yet miss the condition that decides whether a journey works. Another may understand the decision when it is spoken but need explicit support with words on the page. Those observations call for different teaching. Begin with a useful task, watch the learner's route through it, and teach the part that is getting in the way.

The learner chapter uses invented training notices, timetables, project briefs and borrowing conditions. Their familiar purposes create useful connections with work and community life in British Columbia without requiring personal disclosure. Invite learners to suggest other document types they encounter. An invitation to share experience is optional; it does not make anyone a representative of a Nation or community.

Keep all six components in view

SkillPlan identifies six Reading components: identifying the reading task; identifying information; connecting parts; understanding and applying information; evaluating documents; and reflecting on documents (2024, p. 45). The former Essential Skills category Document Use is integrated here and across other skills. Tables, forms, maps, charts and drawings require deliberate instruction in headings, legends, relationships and conditions, not only practice reading paragraphs (p. 46).

Use RD-01–RD-03 to establish purpose and vocabulary, RD-04–RD-09 for searching and connecting information, and RD-10–RD-12 for judging claims and versions. RD-13–RD-15 examine audience, conditions and the limitations of summaries. RD-16–RD-18 ask learners to transfer and explain their process. These are connected opportunities, not six separate tests. Numeracy becomes visible when a timetable requires elapsed time; Communication helps a learner explain a reading choice.

Teach with documents that have a purpose

The first source strategy is purposeful work with authentic documents (pp. 47–48). A real document has been created for an actual activity beyond the class. The learner cases are simulations: label them that way. Their advantage is that all learners receive the same information and nobody needs to expose an employment record, private correspondence or community document. Later, introduce a current, permission-cleared public document and ask what changes when the audience and consequences are real.

Before distributing it, identify the decision a reader must make and check that the document actually supplies the information. Prepare one locate question, one connection question and one question about a limitation. Let learners preview the title, publisher, date, headings and structure. Ask them to predict where they would search. After reading, return to the prediction: which feature helped, and which needed closer attention? This routine makes document design part of instruction.

Build foundations without lowering the purpose

The second strategy addresses alphabetics, fluency, vocabulary and comprehension (pp. 48–49). A diagnostic conversation may reveal difficulty decoding a word, understanding its meaning, keeping a place in a table, or combining two conditions. Do not treat all four as the same problem. Model word analysis when needed; practise a useful word in several sentences; offer repeated reading of a short meaningful passage; and check understanding through a decision rather than copying.

RD-03 offers words such as *optional*, *replaces* and *applies*. Have learners underline nearby clues, try an explanation and test it in a second example. A bilingual glossary or private first-language note can support meaning. Avoid compulsory reading aloud in front of the group. A learner can rehearse privately, read with a partner, or ask for instructor support. When text-to-speech supplies access, record what it supported so that the evidence accurately describes the reading task attempted.

A worked teaching routine

For RD-05, display the fictional connection rule and timetable. Say: “The question asks whether B1 connects with B2. I need a condition as well as two times.” Mark the requirement for at least five minutes. B1 arrives at 08:25 and B2 leaves at 08:28: three minutes is insufficient. B3 leaves at 08:32, giving seven minutes. Point to both the paragraph and the row; a correct number alone does not show that the learner found the rule.

Next invite a pair to explain why merely arriving before departure is insufficient. Give a new pair of times while retaining the rule, then change the rule while retaining the times. This separates understanding from memorizing the first answer. Finally ask learners to identify what would need checking for a real journey. The classroom allowance is invented and must not become advice about an actual service.

This follows the third source strategy: explain a systematic process, model it aloud, work collaboratively, guide another attempt and then release responsibility (pp. 49–50). A useful question routine is: identify requested information, locate a match, determine processing, and reject competing information. Skimming gives an overview; scanning locates a detail; close reading checks its conditions. Teach when to switch between them.

Assess the route, then choose a next step

Collect a marked document and a short spoken or written explanation. Look for accurate location, connections, attention to limits and a justified decision. “Found the right row but omitted the paragraph's allowance” is useful feedback. “Needs better comprehension” is too broad to guide the next lesson. Use a second task after focused instruction to see whether the change holds (pp. 50–51).

Adjust complexity through document length, unfamiliar vocabulary, competing details, number of sources and depth of inference. Increase one demand at a time. A paper version can show whether navigation is masking reading; a simpler response mode can show whether writing is masking comprehension. Record supports and distinguish **Not observed** from an attempted performance that is **Not yet demonstrated**. Classroom feedback categories are not official proficiency ratings. The source's level discussion is developmental, and the current federal learning-steps page also states that proficiency descriptions will be refined.

Short routines and resource choices

Retain all three source grab-and-go patterns (p. 53): compare document features and purposes using RD-02/RD-09; answer task questions while explaining a reading route using RD-13/RD-14/RD-17; and compare documented options using RD-06/RD-18. Each can become a short opening or a longer lesson. Allow an initial attempt, teach the needed strategy, and provide another opportunity with changed information.

The source's Reading resource list on p. 52 is a set of leads, not a list independently verified here. Preview any selected item for adult relevance, accessibility, cost and fit with the specific reading need. Keep technical instruction with the appropriate current provider. A historical trade document can teach version awareness without establishing today's requirements.

Sources and companion work: SkillPlan guide, pp. 45–53; Reading learner chapter; answer guidance; current federal skill components and learning steps.

Teaching Writing: help a reader understand and act

Writing instruction begins with a reader and a purpose. A short message that gives the right quantity, time and confirmation request can be more useful than a polished paragraph that promises something unapproved. Teach learners to select information, organize it, make meaning clear and revise against the source. Grammar and spelling matter because they support that work; they should not displace it.

The learner chapter uses fictional resource requests, materials records, classroom procedures and visitor notices. These purposes connect with training, work and community activity in British Columbia. Invite an alternative context when it serves the same outcome, without requiring private correspondence, family history or cultural knowledge. Learners retain authorship: support may help them produce and review text, but an instructor's rewrite is not evidence of the learner's decisions.

Keep the six components connected

SkillPlan identifies the writing task, planning, producing words and phrases, choosing language and style, using an appropriate format, and reviewing or revising (2024, p. 54). WR-01–WR-04 develop purpose, selection, planning and drafting. WR-05–WR-06 address clarity and audience. WR-07–WR-11 use factual forms, handovers, procedures and tables. WR-12–WR-15 develop notices, tone, source checking and reader feedback. WR-16–WR-18 provide a new context, revision and reflection.

The former Document Use skill remains visible when writers complete forms, arrange a table or prepare a schedule (p. 55). Teach how a label controls an entry and how a blank field differs from a known zero or an unavailable fact. Reading supplies evidence; Numeracy checks quantities; Digital may support composing and saving. Assess these additional demands separately when they obscure the writing decision you want to observe.

Teach grammar inside meaningful writing

The first strategy integrates grammar with purposeful work (p. 56). Begin with a draft and identify a small number of features that affect meaning. A pronoun with no clear referent, a missing sentence boundary or an incorrect quantity is a useful teaching point. Model the repair, explain the misunderstanding it prevents and ask the learner to apply the same idea elsewhere.

WR-05 offers an ambiguous calculator request. Ask the reader to underline words that leave them guessing: “they,” “them,” “before” or “later.” Replace these selectively with the item, actor or time. Do not correct every surface feature at once. Agree a focused editing target and use a brief checklist. Spellcheck and other tools can help locate a possible issue, but the learner must decide whether a suggested change preserves meaning. Respect different language backgrounds and avoid treating a familiar dialect as evidence of weak reasoning.

Make context and audience do real work

The second strategy is context-driven instruction (p. 57). Compare two messages about the same event for different readers. A resource helper needs a quantity and return arrangement; learners attending the session need to know what to bring. WR-06 makes this difference explicit. Ask which details can be omitted without losing the reader's ability to act.

Discuss register as a choice shaped by purpose, relationship and local practice. Clear, respectful language does not require unnecessary formality, gendered titles or elaborate vocabulary. Avoid presenting one email model as the only acceptable voice. Provide several valid versions and compare their usefulness. Peer feedback should answer a reader question—“Can I tell what you need?”—rather than turn classmates into unrestricted editors of each other's style.

A worked teaching example: request the extra quantity

Use Case document A. Twelve learners can work in pairs, so the plan needs six calculators. Four are available. The writer must request **two additional calculators**, needed at 09:00 on Practice Thursday, with return by 11:45. The helper needs the request by 15:00 on Practice Wednesday and must still check availability. Model a planning note with reader, purpose, required facts and unresolved status.

Say: “If I write ‘We need six more,’ the reader may supply ten in total. If I write ‘The calculators are booked,’ I turn a request into a claim I cannot support.” Draft a subject naming two calculators and a short paragraph asking for confirmation. Have a learner play the reader and identify the item, extra quantity, required time and return plan. If any answer is uncertain, revise that sentence.

Then use WR-04 for the learner's own message. Keep the model available as a structure, while asking for independent wording and information choices. Use WR-14 later to check a different draft against its source. The point is a repeatable planning and review process, not memorizing the first request.

Teach a process that can be reused

The third strategy makes the writing process explicit (p. 58): establish purpose, gather information, plan, draft, review and revise. These stages may loop. A reader's question can reveal missing information and send the writer back to the source. Model that return openly rather than implying that experienced writers produce finished text immediately.

Use a template initially, then gradually reduce it. A form can support WR-07, while WR-09 asks learners to select and organize the same event for a handover. WR-10 uses an ordinary classroom procedure; keep it low risk and do not ask a novice to invent a technical operating procedure. Have another learner follow the written sequence with safe materials, identify ambiguity and return the draft to its author. Oral explanation can reveal the intended meaning, but the final written text must carry that meaning itself.

Assess meaning, authorship and revision

Use samples, clear criteria and descriptive feedback (p. 59). A practical rubric asks whether the message fulfils its purpose, uses accurate evidence, suits its reader, follows a usable format and has been reviewed. Discuss sample responses with another instructor to improve consistency. Holistic judgement can summarize effectiveness, while a short checklist pinpoints the next teaching step.

Adjust complexity through audience, amount of information, format, inference, length and consequences. Record typing, handwriting, speech-to-text or scribing support accurately. A scribed text can show writing decisions when the learner controls wording and revisions; a conversation without a learner-authored text cannot establish the full writing outcome. Separate **Not observed** from **Not yet demonstrated**, and offer a fresh attempt after instruction. Do not convert a short classroom rubric into an official proficiency level.

Retain all three grab-and-go patterns on p. 61: model and revise email tone through WR-04/WR-13; complete a factual incident-style record using WR-07–WR-09; and write then explain a procedure using WR-10. Use synthetic events rather than personal incidents. The resource list on p. 60 supplies leads whose availability, accessibility and fit must be checked before use.

Sources and companion work: SkillPlan guide, pp. 54–61; Writing learner chapter; answer guidance.

Teaching Numeracy: connect the question, the quantities and the decision

Numeracy develops through useful questions and visible reasoning. A learner may calculate accurately but choose the wrong quantity; another may understand the relationship and need help recording it. Start by finding out what the learner already does with numbers, then distinguish reading the problem, choosing a method, calculating and interpreting. The teaching response should address the point of difficulty rather than repeat the whole task unchanged.

The learner chapter offers fictional supply orders, journey planning and an information-board layout. These connect with training, employment and community tasks in British Columbia while keeping personal finances and private circumstances outside the exercise. Learners may bring another non-sensitive context if they wish. Recognize experience in estimating, sharing quantities, planning time and checking materials without assuming that every learner has the same experience.

Use the complete numeracy cycle

The six components are identifying the task; identifying mathematical information; connecting information; applying operations and tools; interpreting and evaluating; and sharing results and implications (SkillPlan, 2024, p. 62). Keep all six visible. A worksheet that ends at a calculator answer leaves interpretation and communication unobserved. Ask what the answer means, whether it is plausible and what another person needs to know before using it.

NU-01–NU-06 develop this cycle through quantities, stock, packs and budget conditions. NU-07–NU-10 use time and fares. NU-11–NU-16 distinguish units, area, perimeter, fit and data displays. NU-17–NU-18 require transfer and a numerical handover. Tables, graphs and diagrams integrate Document Use throughout (p. 63). Correct a source labelling error when planning: component 6 concerns sharing results; it is not another instance of choosing operations.

Attend to confidence and the learning conditions

The first source strategy addresses attitudes and emotions around mathematics (pp. 64–65). Invite a private statement of what would make practice easier. Do not ask for public accounts of school failure or turn confidence into a score. Predictable routines, time to think, worked examples, useful tools and specific feedback can make a task more approachable. Offer counters, sketches, enlarged tables or spoken explanation while preserving the adult purpose.

Avoid praising speed as evidence of understanding. Ask a learner who answers quickly to explain the units and check a condition. Give another learner time to draw the relationship. Both may demonstrate strong reasoning. If a learner says “I cannot do maths,” respond with an observable starting point: “You identified what the cupboard already contains. Let us connect that to the amount needed.” This locates something teachable without making an unsupported promise about progress.

Make context support the mathematics

The second strategy uses meaningful contexts and explicitly teaches missing foundations (pp. 65–66). Before introducing a formula, establish what is being counted or measured. Write units beside quantities. Ask for an estimate before exact calculation and a second check afterwards. A calculator is appropriate when it supports the intended task; show how to detect a mistaken input or an implausible result.

Context can also overload a learner. Separate a long paragraph into a quantity table while retaining its conditions. Practise one foundational relationship, then return to the full decision. Do not replace every task with isolated arithmetic: the return to context shows whether the learner can choose and use the method. When changing a scenario, distinguish invented assumptions from real workplace specifications. These lessons do not establish material tolerances, equipment capacities or operating instructions.

A worked teaching example: whole packs

Use the pen order in NU-03. Eighteen learners need two pens each, and the group wants four spares. The target is `18 × 2 + 4 = 40 pens`. Nine usable pens are already available, so the additional requirement is `40 − 9 = 31 pens`. Each pack contains 12 pens. Two packs provide only 24, while three provide 36; therefore the order needs three whole packs.

Continue beyond the purchase count. At $6.60 per pack, the pens cost `3 × $6.60 = $19.80`. Existing stock plus the purchase gives `9 + 36 = 45 pens`, leaving five beyond the target. Check by estimation: three packs at about $7 should cost about $21, close to $19.80. Ask why rounding 31 ÷ 12 down would fail. The answer is tied to complete packs and sufficient supply, not a universal instruction to round every result upward.

Model the calculation once, then give pairs the folder or label row. One person explains the relationship; the other checks quantities and units. Swap roles before using NU-04 to combine the order and delivery condition. A correct line item does not yet answer whether the whole purchase fits the budget.

Structure collaboration so everyone reasons

The third strategy uses collaborative learning (pp. 66–67). Give partners a purposeful difference in responsibility: proposer and checker, estimator and calculator, or diagram-maker and explainer. Rotate roles. Ask for two methods where they illuminate the same relationship, such as a timeline and subtraction for elapsed time. Invite disagreement about a method using the quantities and assumptions, not a judgement about the person.

A group answer alone cannot show each learner's numeracy. After discussion, ask everyone to solve a small variation or explain one decision. Offer a private instructor conversation when public explanation is a barrier. Link the handover in NU-18 to Communication and Writing, but assess those demands separately if they obscure the mathematical evidence.

Assessment, complexity and next practice

Use diagnosis, observation, work samples and a retry after feedback (pp. 67–68). Record whether difficulty arose in locating data, translating the situation, choosing operations, calculating or interpreting. Increase complexity through more steps, less obvious information, different representations or additional conditions. Avoid increasing all of these at once. Digital navigation and reading demands can conceal numerical understanding; provide another route when the aim is numeracy.

The source's three grab-and-go patterns are measuring with an imperial tape and fractions, calculating volume or mass from supplied data, and working with percentages and graphs (p. 70). NU-14 supports unit-system reading and NU-15 combines charting with a fraction and percentage. For physical measurement, use a ruler or instructor-handled tape on a safe classroom object. Locate zero, identify the smallest marked fraction and compare two readings; never measure a resized illustration as if it were full scale.

For the volume-to-mass pattern, provide this additional fictional calculation: a rectangular box has inside dimensions `0.5 m × 0.4 m × 0.2 m`. Its volume is `0.04 m³`. Assume an invented practice material has a mass of `500 kg per m³`; the stated relationship gives `0.04 m³ × 500 kg/m³ = 20 kg`. Check: the box holds one twenty-fifth of a cubic metre, so its contents have one twenty-fifth of 500 kg. Ask learners to explain why adding the three lengths would not find volume, then halve the depth: volume becomes `0.02 m³` and mass `10 kg`. These are calculation assumptions, not asphalt properties, handling advice or equipment limits. The resource page, p. 69, supplies further leads to preview.

Sources and companion work: SkillPlan guide, pp. 62–70; Numeracy learner chapter; answer guidance. Record classroom evidence and supports rather than assigning an official proficiency level from a short activity.

Teaching Digital: make useful work that can be found, checked and protected

Digital teaching is strongest when a learner has a reason to use a tool and enough control to learn from the attempt. A person may be comfortable messaging on a phone and unfamiliar with folders, spreadsheets or a shared computer. Begin with that specific experience. Neither age nor confidence predicts what someone can demonstrate. Ask what the learner wants to accomplish and observe a small, relevant action.

The learner chapter uses fictional classroom equipment-card records and training notices. It offers a practical route from device access to a retrievable file, source evaluation, careful sharing and learning another method. These tasks support work and community participation in British Columbia without requiring a personal account, public post or disclosure of passwords. Arrange a designated practice location and confirm the permissions on shared equipment before class.

Cover the six components through purposeful actions

The source identifies using devices, common tools, digital information, online platforms, safe and responsible practices, and updating digital skills (SkillPlan, 2024, p. 71). DG-01–DG-03 establish device and file control. DG-04–DG-06 build a useful record. DG-07–DG-09 examine digital information; DG-10–DG-12 address public online sources and navigation. DG-13–DG-15 develop protection and sharing decisions. DG-16–DG-18 ask learners to test a new method and plan transfer.

Document Use appears in tables, menus, forms, search results and file structures. Reading supports source evaluation, Numeracy supports formulas, and Problem Solving supports troubleshooting. Name these connections, then keep the evidence precise. A learner who explains a paper screenshot has demonstrated useful reasoning but has not yet demonstrated control of the application.

Start with an individual needs assessment

The first strategy is a practical needs assessment (pp. 72–73). Invite learners to name familiar tools and observe a short task such as opening, editing, saving and reopening a practice file. Ask what happened when the learner last needed help, without requiring access to personal material. Identify device availability, connectivity, access methods and the tasks needed for the person's goals.

Use this information to choose a starting point. One learner may need pointer practice; another may need file versions; another may be ready to compare online evidence. Do not make the whole group repeat an introductory sequence merely because one person needs it. Provide a common purpose with different supports and opportunities to extend. Learners using voice control, keyboard navigation or other accessible interfaces should demonstrate equivalent actions rather than imitate a mouse-based route.

Build confidence through supported control

The second strategy develops confidence with timely support (p. 73). Demonstrate a short action, explain its purpose and let the learner take control. Resist completing the task while the learner watches. Ask permission before taking over a device, then return control and ask for a repeat. Keep a brief help card available, including how to undo a change or ask for assistance.

DG-02 makes an access adjustment a purposeful experiment: predict its effect, try it, judge usefulness and restore it when appropriate. DG-03 makes saving visible by closing and reopening the file. These checks are more informative than “Did you understand?” Pair learners carefully and rotate device control. A confident partner can coach, but the record must show whose actions were observed.

Teach the technical action and the reason together

The third strategy uses problems that join technical procedures with contextual decisions (p. 74). For a card-count record, selecting a spreadsheet is sensible because counts will change and totals must be recalculated. For a short visitor explanation, a text document may be sufficient. DG-04 asks for reasons and limitations rather than one universally correct application.

Use small iterations: create a draft, test it, receive a change and check the result. Teach file names, versions, meaningful headings and access boundaries as parts of making useful work. When an unexpected menu or error appears, model reading the message, describing what happened and trying a reversible step. Searching for help is productive when the learner can state the application, action and problem without exposing private information.

A worked teaching example: check the changed record

In DG-05 the fictional card record contains 24 prepared sets and 16 checked sets, leaving eight. Demonstrate `prepared − checked = remaining` using the first row: `8 − 5 = 3 sets`. Explain that a formula performs a relationship; it does not establish whether the entries are correct. Check each row against the supplied case, then compare the totals.

For DG-06, two additional Road users sets are checked. Its checked count changes from seven to nine while prepared sets remain ten. The row now has one remaining set. Total checked becomes 18 and total remaining becomes six; `24 − 18 = 6` confirms the relationship. Ask the learner to predict the change before editing and explain why prepared sets stay unchanged. Save the second version and reopen it.

Collect the editable file, a brief change note and an observed explanation. A screenshot may show the result but cannot establish that the learner can edit, retrieve or inspect a formula. If formulas are not the intended target, a clearly documented alternative calculation can support the task; record exactly what was used.

Teach protection without collecting secrets

Use the suspicious-message case and practice sharing decisions in DG-13–DG-15. Ask what the requester needs, what remains uncertain and how to verify through a known channel. Discuss unique passwords, suitable password management and multifactor authentication using fictional examples and the program's current

guidance. Never ask learners to reveal a password, recovery code or private account screen. Explain that a public link may expose more than the immediate recipient needs.

The source's password activity on p. 77 contains instructional tips copied from a numeracy activity. Do not reproduce them. Keep the intended safety practice but use current, relevant guidance. The same page's other two grab-and-go patterns—comparing tools and evaluating websites—are supported by DG-04 and DG-07–DG-12. Preview selected websites for accessibility and suitability before class.

Gather evidence and plan continued learning

Assessment should combine observed performance, a usable product, reflection and feedback (p. 75). Self-report helps select teaching but cannot replace performance. Adjust complexity through number of tools, unfamiliarity, steps, information ambiguity and troubleshooting. If connectivity prevents online work, mark that component **Not observed** and arrange a later opportunity; do not count a paper substitute as online performance.

Finish with DG-16–DG-18: retain one effective learning strategy and test it on a second method. The source's resource list on p. 76 contains further leads, whose current availability and suitability require checking. Its developmental proficiency descriptions should not become a score assigned from a single session.

Sources and companion work: SkillPlan guide, pp. 71–77; Digital learner chapter; answer guidance.

Teaching Problem Solving: investigate before committing to an answer

Problem solving is a process of making a justified decision under stated conditions. Learners need practice defining an issue, gathering information, exploring possible explanations, comparing responses, acting and checking the result. A correct suggestion made quickly does not reveal all of that reasoning. Ask learners to show what they know, what they are assuming and what would change their recommendation.

The learner chapter uses fictional device scheduling, repeated card-label corrections and a display request with unresolved permission. These cases connect with B.C. training and community tasks without making people or communities into problems. Frame the issue as a situation to understand. Replace judgemental explanations such as “people do not care” with observations and questions that can be investigated.

Use the complete six-part cycle

The source identifies defining the issue, gathering information, analysing, developing multiple routes, addressing the issue, and evaluating effectiveness (SkillPlan, 2024, p. 78). PS-01–PS-03 establish the issue and responsibilities. PS-04–PS-06 gather and organize information. PS-07–PS-09 examine explanations and assumptions. PS-10–PS-12 generate and test options. PS-13–PS-15 make an action plan that respects new information and permission. PS-16–PS-18 evaluate and transfer the method.

These stages can loop. New information may change the problem statement; an unsuccessful trial may require another explanation. Reading and Document Use support briefs, evidence tables and cause maps. Numeracy can compare time, cost and proportions. Collaboration contributes other perspectives, while Adaptability helps a learner revise an idea without treating revision as defeat.

Use guided problems with enough information to reason

The first source strategy uses problem-based learning with guidance (p. 79). Choose a case with a clear purpose, meaningful constraints and more than one possible response. Give learners time to formulate the issue before proposing a solution. Ask “What must be true of any acceptable response?” and distinguish a requirement from a preference.

PS-02 makes this distinction concrete: every learner needs an actual tool turn, the extra budget cannot exceed $50, and individual availability must be respected. Finishing everybody by 10:00 is preferred. If learners treat every preference as compulsory, they may reject a workable response. If they treat a requirement as optional, a convenient plan may fail the task. Discuss these differences using the supplied brief rather than the instructor's unstated expectations.

Scaffold the first attempt with a simple issue statement and an information table. Reduce support on a new case. Do not withhold essential prerequisites or reward guessing facts that were never supplied. “Ask the responsible person” can be a sound next action when a decision depends on missing authority or information.

Teach systematic inquiry and cause analysis

The second strategy teaches repeatable methods, including cause-and-effect mapping and successive why questions (p. 80). Model gathering evidence before settling on a cause. In PS-07–PS-08, learners distinguish known observations from untested possibilities about repeated label corrections. A fishbone-style map can organize possible contributors such as file names, instructions, display and checking processes.

The Five Whys approach is a prompt for deeper inquiry, not a rule that exactly five questions reveal one true cause. Several conditions can contribute, and an explanation still needs evidence. Ask what observation would support or weaken a proposed link. Include system conditions, not only individual actions. Do not use classroom cause analysis to diagnose a person or replace a required investigation of a real incident.

A worked teaching example: two feasible routes

Use Case A and PS-11. Each digital turn lasts 25 minutes, and a five-minute reset is needed between groups. With five devices, ten learners require two groups: `25 + 5 + 25 = 55 minutes`. Two loan devices restore five available devices for $40, within the $50 budget, provided the reservation is confirmed by 08:30. Starting at 09:00, this route ends at 09:55.

With the three remaining devices, four groups are needed: three learners, three, three and one. The duration is `4 × 25 + 3 × 5 = 115 minutes`, ending at 10:55. This can respect everyone's availability if the three learners leaving at 10:00 receive early turns. It costs nothing extra but does not meet the preferred early finish. Both routes can be justified under the supplied conditions.

Ask learners to explain why the $60 later room and a paper-only substitute fail stated requirements. Then invite them to defend either feasible route while naming a drawback. PS-12 asks a partner to challenge the choice respectfully. A revised recommendation may demonstrate stronger reasoning than defending the first idea. This is a classroom scheduling example, not authority to book equipment or spend program funds.

Use discussion to examine assumptions

The third strategy uses group reasoning, different perspectives and role-play (p. 81). Ask individuals to draft an initial view before group discussion so that one voice does not determine the options. Give an observer the task of noticing evidence, assumptions and questions. Rotate facilitator and challenger roles, and require a reason rather than a personal judgement.

PS-09 challenges a claim that a new folder proves earlier carelessness. The record supports possible process improvements; it does not establish motivation. PS-15 adds a permission question: an attractive display idea does not authorize use of knowledge or imagery. Learners should identify whose decision is needed and a useful alternative while permission remains unresolved. Respecting that boundary is part of solving the actual problem.

Evaluate outcomes without overstating causation

Assessment should examine process, evidence, action and reflection (p. 82). Use a rubric that accepts different justified responses. Record how much support was needed and whether the learner can repeat the process on a changed case. Increase complexity through ambiguity, number of constraints, competing perspectives or less direct consequences rather than simply making the text longer.

PS-17 compares nine corrections among 30 sets with one among 20: 30% before and 5% after, a difference of 25 percentage points. The lower recorded proportion is promising, but the small, uncontrolled record cannot prove that one change caused the improvement. Ask for a limitation and the next observation. PS-16 likewise prevents attendance from being mistaken for proof that every learner used a device.

The three source grab-and-go patterns are a complete problem cycle, questioning around conflict and alternatives, and considering measurable effects and affected people (p. 84). The cases and PS-01–PS-18 provide these routes. Use communication evidence without scoring eye contact or stillness. Preview the resource leads on p. 83 before selection; provisional proficiency descriptions should not become a rating from one classroom problem.

Sources and companion work: SkillPlan guide, pp. 78–84; Problem Solving learner chapter; answer guidance.

Teaching Communication: build a shared understanding and check it

Communication instruction needs both a sender and a receiver with a reason to exchange information. A fluent presentation may leave the audience unsure what to do. A brief clarification can prevent an important misunderstanding. Teach learners to identify the purpose, receive the message, organize a response and confirm meaning. Observe what the interaction achieves rather than how closely a learner matches one preferred speaking style.

The learner chapter uses fictional classroom changes, a misunderstood card task and a visitor explanation. These settings support practice relevant to B.C. training, work and community life without requiring disclosure of personal experiences. In an ACCESS IS4S classroom, ask about the communication needs of the person and task. Do not assign preferences from identity or ask a learner to speak for a Nation or community.

Include all six components and accessible modes

SkillPlan names listening with intention, listening to understand, speaking clearly, speaking with purpose, adapting to audience and context, and adapting to different modes and tools (2024, p. 85). The learner chapter provides three activities for each: CM-01–CM-03, CM-04–CM-06, CM-07–CM-09, CM-10–CM-12, CM-13–CM-15 and CM-16–CM-18 respectively. Use this sequence flexibly, returning to a component when a later task reveals a need.

The component names use speaking and listening, while the purpose can be supported through speech, sign, text, augmentative and alternative communication or another agreed mode. Record the mode and support accurately. Give every learner turns sending, receiving and clarifying. Document Use appears when a diagram, schedule or reference card carries part of the message; Reading helps inspect it, while Collaboration supports shared turn-taking and repair.

Teach intercultural reflection without stereotypes

The first source strategy concerns intercultural competence (pp. 86–87). Begin with the difference between an observation and an interpretation. “The learner paused and looked at the map” is observable. “The learner was uninterested” is an interpretation requiring more information. Invite several possible explanations, then a respectful question about what would help the exchange.

CM-14 provides this practice; CM-15 replaces stereotype-based questions with choices relevant to the current task. A useful question is, “Would key points in writing or a spoken review help you check this map?” The answer may vary by task. Cultural knowledge is not automatically available for classroom use. Arrange appropriate relationships and permission when a real project calls for a particular community perspective; use the supplied fictional cases for these exercises.

The source's Describe–Analyze–Evaluate activity on p. 91 can be taught through CM-14. Describe the event without judgement, analyse possible meanings, and evaluate a response by its usefulness and evidence. Avoid treating one interpretation as a universal cultural rule. Learners may reflect privately or use a fictional example rather than recount a difficult personal interaction.

Make listening an explicit, teachable action

The second strategy teaches active listening (pp. 87–88). Model preparation, attention to purpose, paraphrasing, clarification and confirmation. Show that an accurate paraphrase preserves the message's limits. A listener should not add an attractive promise merely because it would make the plan easier. A sender shares responsibility by checking the paraphrase and correcting omissions.

Use CM-01 to identify the information needed before receiving a message. CM-02 addresses barriers such as overlapping talk or inaccessible text. CM-03 looks for a useful response. Attention may include looking at a diagram, taking notes, using a device or pausing. Do not grade eye contact, stillness, accent or one response pace. Those features cannot establish comprehension and may reflect different access needs or communication practices.

A worked teaching example: preserve a room change

Use Case A. The current message places Thursday's indoor classroom session in Room 2, from 10:00 to 10:45, and asks learners to bring a workbook and pen. Printed process maps will be available. Model a concise check-back: “The indoor session is now in Room 2, starting at ten and ending at ten forty-five. I bring my workbook and a pen; maps are supplied. Is that correct?”

Have the sender compare the paraphrase with the source rather than automatically agreeing. Then model an unanswered question: “Will transport be provided?” The message contains no transport arrangement. A useful response identifies that limit and asks the responsible course contact; it does not invent a bus. This distinction matters because helpful intentions can still produce inaccurate instructions.

In CM-06, a partner repeats the old Room 1 location and an 11:00 finish. Practise describing the discrepancy and checking the current message together. The outcome is an agreed version or an explicit question for the instructor, not a judgement about the person who repeated the old information. Repeat with another comparable message so that successful recall of the first script is not mistaken for transferable listening.

Use simulations with feedback and another attempt

The third strategy uses role-play and simulations (pp. 88–89). Keep roles simple and the purpose clear. Demonstrate one exchange, allow rehearsal, observe a short attempt, give one useful piece of feedback and repeat with roles reversed. Let learners pause or choose an instructor partnership. They should not imitate another person's disability or perform a cultural stereotype.

CM-07–CM-09 develop plain explanations and clear references; CM-10–CM-12 distinguish a request, clarification and handover. CM-13 changes the audience while retaining the technical meaning of the introductory map. CM-16–CM-18 change the mode and require a question-and-response check. A connected

call or delivered message is not proof that the recipient understood it. Ask what information was confirmed and what remained pending.

Assess understanding without introducing an unrelated barrier

The source discusses direct observation, suitable assessment tasks and the danger of confusing listening with writing (pp. 89–90). A short paraphrase, selected response, relevant action or clarification can show understanding without an extended written summary. If learners studied the printed script first, record that preparation. Use a new comparable message when the aim is to observe reception of unfamiliar information.

Live observation is sufficient; recordings require an agreed purpose and consent. Keep evidence specific: “Asked which version applied and repeated the confirmed room and time.” Increase complexity through more details, an unfamiliar audience, ambiguity or a changed channel. Keep access supports available and distinguish an unobserved component from an unsuccessful attempt. Classroom feedback categories do not establish official Communication proficiency levels.

All three source grab-and-go patterns are retained: Describe–Analyze–Evaluate through CM-14; identifying and practising useful listening behaviours through CM-01–CM-06; and receiving instructions with a check-back through CM-04/CM-08. Preview the source's resource leads on p. 90 for current availability and fit. Finish with a specific next practice, such as shortening a paraphrase while preserving its conditions, then observe that change in another exchange.

Sources and companion work: SkillPlan guide, pp. 85–91; Communication learner chapter; answer guidance.

Teaching Collaboration: make participation and coordination observable

A group can produce excellent work while one person makes every decision. It can also share responsibility thoughtfully and still need help correcting a factual error. Teaching Collaboration means attending to both the shared result and the interactions that produced it. Give learners a worthwhile common purpose, teach the practices that support it, and make each person's contribution visible without ranking personalities.

The learner chapter asks a team to prepare a fictional visitor information pack about introductory asphalt learning. The case supplies the facts, timetable and changes. It does not ask learners to simulate a Nation's governance or share community knowledge. In an ACCESS IS4S classroom, relationships matter, and participation must allow different communication modes, time to think and the choice to keep personal information private.

Teach all six components

SkillPlan's components are working well with others; valuing diversity and inclusion; managing difficult interactions; facilitating a collaborative environment; achieving a common goal; and reflecting to improve teamwork (2024, p. 92). These component labels belong to the 2024 source; current federal wording may differ slightly. Use them to notice actions rather than to assign a permanent description of a learner.

CL-01–CL-03 establish the shared purpose, agreements and roles. CL-04–CL-06 address inclusion and permission around knowledge. CL-07–CL-09 separate factual disagreement, design choice and situations needing support. CL-10–CL-15 coordinate, revise and test a shared product. CL-16–CL-18 turn reflection into another attempt. Reading, Writing, Digital and Numeracy contribute to the pack, but their accuracy must be assessed separately from how the team works.

Begin with relationships and clear agreements

The first source strategy builds relationships and trust (p. 93). Use introductions that let people choose what to share. Invite each learner to name a useful contribution or a way they prefer to receive instructions. Avoid assigning roles by confidence, gender, age, cultural identity or previous job title. The quiet learner may be an excellent facilitator when given a clear structure; the confident speaker also needs practice listening.

CL-02 asks for observable working agreements. Help a team replace “be respectful” with “ask before replacing another person's wording” or “offer a printed copy before reviewing the shared screen.” Ask how someone can request a pause, challenge a claim or contribute through writing. Agreements should support participation rather than require disclosure. Check them during the work: an agreement has little value if nobody can use it when decisions become hurried.

Explicitly teach the interaction

The second strategy makes collaboration skills an instructional target (p. 94). Merely putting learners into groups does not teach a handover, a source-based disagreement or a useful invitation. Model one practice, let pairs try it, provide descriptive feedback and repeat with roles exchanged. Show the difference between describing an observable issue and making a judgement about someone.

For a handover, model three parts: what is finished, what is uncertain and what needs checking. The receiver restates the message before continuing. CL-03 and CL-10 offer practice, while CL-11 tests whether another person can use the output accurately. This connects Communication with the document-use demands of task boards, source briefs and draft versions. A spoken handover and a written board can complement one another.

A worked teaching example: fact, preference or process?

Use Case document 2 and CL-07. The draft says a roller places asphalt. The supplied introductory card assigns placement to the paver and compaction to rollers. Say: “This is a factual question with evidence available. Voting would tell us what the group prefers, not whether the sentence matches the source.” Model a correction that identifies the wording and evidence without labelling its author.

The same case includes a preference for a flow diagram versus question-and-answer boxes. Neither layout has been tested. Ask learners to set a criterion: can a visitor quickly find who owns the fictional road? Sketch both versions and ask a reader to use them. Record what the reader finds, then decide. The absence of an agreed correction process is a third issue; it needs a team agreement about checking and approving changes.

Have pairs rehearse this distinction in CL-08, with an observer recording one exact phrase that helped. Stop role-play if it becomes personal or discriminatory. CL-09 explicitly distinguishes ordinary task disagreement, conflicting sources and harmful behaviour needing instructor support. Demonstrating collaboration never requires tolerating harm or inventing a workplace reporting procedure.

Structure group work so everyone can act

The third strategy uses purposeful small-group activity, varied roles and active monitoring (p. 95). Teams of two to four are manageable for this pack, but select grouping to fit the room and access needs. Provide each learner with the source. Rotate coordinator, source checker, drafter and reader-test roles; a person operating the keyboard should not automatically control decisions.

CL-12 gives a bounded five-minute facilitation turn. Observe whether the facilitator states a purpose, invites contributions, checks a dependency and confirms next actions. A written contribution or supported communication route counts. CL-13 adds a change in device access and requested formats. Ask everyone to identify one changed and one unchanged condition before the team revises its board. This makes Adaptability visible without quietly losing a member's role.

Do not stand back until a team fails. Monitor early and offer the smallest useful prompt. If one person has no access to the shared document, repair access before judging contribution. If a team is progressing, ask a question that deepens checking rather than taking over its decision.

Assess contribution, product and improvement separately

The source recommends observation, meaningful tasks, reflection and formative feedback (p. 96). Keep a brief evidence record: action, context, support and effect. “Invited a written response and used it to correct the schedule” is observable. “A natural team player” is not an instructional finding. Include self- and peer feedback, but teach contributors to describe events rather than award popularity scores.

Increase complexity through dependencies, changing resources, multiple perspectives or less obvious solutions. Keep participation conditions fair. Use CL-15 to distinguish product evidence from interaction evidence, then CL-16 to test one improvement. CL-18 brings the six components together. An unobserved role needs another opportunity; it should not be recorded as a failed performance.

All three source grab-and-go patterns remain available (p. 98): a low-stakes shared task followed by reflection, discussion of context-specific social or workplace expectations, and practice with difficult interactions. The visitor pack, CL-02/CL-17 and CL-07–CL-09 respectively provide those routes. Give necessary prerequisites and safe materials even when an initial attempt is used diagnostically. The resource list on p. 97 is a set of leads to preview, not independently verified recommendations.

Sources and companion work: SkillPlan guide, pp. 92–98; Collaboration learner chapter; answer guidance; current federal learning steps.

Teaching Adaptability: preserve the purpose while revising the approach

Adaptability becomes visible when a learner notices a change, considers its consequences and chooses a workable response. It may involve continuing, changing a method, asking for support or revising a commitment. Teach these decisions explicitly. A calm appearance does not prove that a learner has understood a changed task, and visible frustration does not show an inability to adapt.

The learner chapter uses a fictional learning folder, reduced device access and feedback on a project note. It provides changes that can be discussed without asking learners to recount distress, employment conflict or family responsibilities. In an ACCESS IS4S classroom, acknowledge that people already navigate changing circumstances. Do not turn that recognition into an expectation that individuals must overcome inaccessible systems without support.

Keep the six components distinct

The source names responsibility; persistence and perseverance; regulating emotions when appropriate; setting or adjusting goals; planning and prioritizing; and seeking improvement (SkillPlan, 2024, p. 99). Teach responsibility as an honest account of commitments and evidence. Teach persistence as purposeful continued effort that can include changing strategy. Emotional regulation here concerns a learner-selected action that supports the task; it is not an assessment of feelings or personality.

AD-01–AD-03 establish purpose and a plan. AD-04–AD-06 offer optional response strategies and boundaries. AD-07–AD-09 examine persistence. AD-10–AD-12 revise a goal and communicate the arrangement. AD-13–AD-15 use feedback and prepare for another change. AD-16–AD-18 test a strategy and assemble evidence across all components. Numeracy supports time allocation, Reading supports interpreting updates, and Communication makes changed commitments clear.

Pair a growth orientation with useful support

The first source strategy promotes a growth mindset through feedback and opportunities to improve (p. 100). Make the pathway to improvement concrete: identify a feature in the current work, demonstrate a strategy and allow another attempt. Avoid telling a learner that effort alone will remove every barrier. If device time disappears, the learning arrangement needs to change; the learner cannot solve that shortage simply by believing more strongly.

Use before-and-after work samples. Ask which action made a difference and what support was used. Praise a useful decision rather than a fixed trait: “You checked the owner against the brief and corrected the note” gives more guidance than “You are adaptable.” Offer accessible formats and different ways to show the target skill. A choice that enables a learner to act is part of good teaching, not a reduction in the learning goal.

Offer strategies for attention and response by choice

The second strategy concerns focus and emotional regulation (p. 101). Establish a short menu: reread the written change, ask for one point at a time, use a checklist, request a brief pause or seek private clarification. Model a task-focused message such as, “I need five minutes to compare the versions; then I will confirm the next step.” Learners can practise with an invented change in AD-05.

Do not require closing eyes, breathing exercises, personal disclosures or a cultural practice. These may be meaningful choices for some people, but they are not universal prerequisites for adaptability. Keep instructional support within your role and follow the program's established support arrangements when a learner asks for help beyond teaching. The observation is the chosen action and its usefulness, not whether someone appeared sufficiently relaxed.

AD-06 adds an essential boundary: a request to skip a source check does not authorize a false completion claim. Practise a response that states what can be done, what remains pending and a reasonable next step. Adaptability includes protecting the integrity of the work.

A worked teaching example: revise the folder plan

Begin with Case document 2. Thursday shrinks from 90 minutes to 60, and device access is limited to the final 25 minutes. The original digital allocation was 35 minutes. Model three columns: changed conditions, unchanged outcomes and decisions to confirm. The 30-minute reduction affects the work period; the 10-minute shortfall concerns device time. Those are related but different quantities.

The note can be drafted from checked paper information before the device is available. A workable plan uses the first 35 minutes for a 25-minute draft and a 10-minute source review, then the final 25 minutes for the agreed digital actions. The offered Monday appointment supplies another 10 minutes. The instructor has agreed a Monday completion arrangement for the digital evidence; the Friday review can remain partial.

Ask learners what this plan does and does not demonstrate. It shows planning, but actual device actions still require observation. A paper plan cannot establish saving and reopening a file. Have pairs use AD-11 to propose a schedule, then AD-12 to communicate the commitment and check the listener's understanding. Accept different workable sequences when they respect the stated conditions.

Vary situations and make reflection actionable

The third strategy develops flexibility through varied scenarios, practice and adaptive leadership (p. 102). Introduce one manageable change at a time: a different file layout, revised information or an unavailable resource. Give enough information to reason and a route to clarify what remains unknown. Avoid surprise pressure as a proxy for authentic learning.

In AD-13–AD-14, feedback identifies specific errors: the owner and contractor are confused, funding is called profit, requirements are overgeneralized and unfinished digital work is described as complete. Learners convert the feedback into actions, revise the note and ask a reader to check the new meaning. The useful lesson is that revision can preserve the concise format while changing unsupported claims. AD-15 then transfers the approach to a different computer arrangement.

Observe development over time

Assessment needs several sources of evidence and repeated opportunities (p. 103). Keep an original goal, changed condition, chosen response, support, result and next step. Self-reflection is useful alongside observation, not as a substitute for it. Increase complexity through multiple changes, competing priorities or a less familiar context, while keeping access and expectations clear. Do not grade optimism, emotional display or willingness to tolerate unfair conditions.

The three source grab-and-go patterns are goal-setting with reflection, optional refocusing practice, and adapting instruction to learners' needs (p. 105). AD-02/AD-17, AD-05 and the choices throughout this chapter support these patterns. Offer specific, checkable goals with meaningful timeframes, but revise them when circumstances warrant. Adapt teaching from individual evidence rather than demographic assumptions. Preview the resource leads on p. 104 before using them; the source's developmental levels are not an official classroom rating scale.

Sources and companion work: SkillPlan guide, pp. 99–105; Adaptability learner chapter; answer guidance.

Teaching Creativity and Innovation: develop an idea through use and feedback

Creativity can begin with an ordinary difficulty: a label is unclear, materials are hard to find or a schedule does not answer a reader's question. Innovation involves putting an idea into use and learning from the result. Teach learners to notice an opportunity, generate alternatives, develop a small version, test it and revise. A polished object alone cannot show that process.

The learner chapter uses a fictional practice-card shelf. Learners can change labels, organization and classroom checking steps using simple materials. The setting allows useful experimentation without changing equipment procedures or drawing on protected knowledge. In an ACCESS IS4S classroom, welcome varied ways of making and explaining while leaving ownership with the learner. No one needs to produce a cultural design or disclose personal knowledge to demonstrate creativity.

Make all six components visible

The source identifies imagination and curiosity; identifying opportunities; generating ideas novel to oneself or others; developing ideas; applying ideas; and facilitating a creative environment (SkillPlan, 2024, p. 106). Creativity does not require a world-first invention. An idea can be new to a learner or useful in a particular setting. Teach its value through the task it helps someone perform.

CI-01–CI-04 investigate and frame the opportunity. CI-05–CI-07 generate alternatives and challenge assumptions. CI-08–CI-10 compare features and develop a prototype. CI-11–CI-15 test, revise and make limited claims. CI-16–CI-18 facilitate, transfer and collect evidence. Document Use appears in labels, contents lists and version records. Problem Solving structures inquiry, Collaboration supports feedback, and Digital can provide another making tool when it suits the task.

Connect creativity with a real purpose

The first source strategy uses practical applications and visible products (pp. 107–108). Begin by asking whose task could become easier. The shelf case supplies waiting-time observations but does not establish their cause. Have learners separate what they know from what they would need to ask or observe. A design question should leave room for alternatives rather than hide a preferred solution inside its wording.

CI-02 asks, “How could we help a learner…” A useful completion might focus on finding and checking the Number Check kit without remembering its contents. “Make everyone use a better folder” selects a tool too early. Compare these questions and ask what each allows the learner to investigate. Use fictional viewpoints in CI-03 so that nobody must represent a disability, identity or entire community.

Keep a visible brief with requirements: accurate contents, plain language, black-and-white usability, no personal data and manageable updating. A striking design that ignores those conditions is not ready to use. Constraints can help learners make choices, provided the limits are explicit and leave meaningful room to

think.

Separate idea generation from selection

The second strategy teaches a structured creative problem-solving process (p. 109). Allow a period of divergent thinking before comparing options. Learners can sketch, speak, write, arrange materials or use an accessible tool. Ask for genuinely different approaches, such as a contents-list folder, matching board and return tray, rather than three colours of the same design.

During generation, invite clarifying questions and possible extensions. During selection, compare ideas against the brief and investigate uncertainties. “No criticism” is a temporary protection for early possibilities, not a ban on checking facts or feasibility. Teach the change between phases explicitly. A table can help organize criteria, but guessed scores do not make a decision objective. Label predictions, and revisit them after a test.

Use CI-06 to practise supporting another person's unfinished idea. The listener asks a question and offers an extension; the author decides what to use. Credit the contribution with permission. This routine helps prevent a confident partner from taking over the work while believing they are helping.

A worked teaching example: a testable contents system

Use the Number Check kit. Version 1 contains one data table, one worked example and two blank record sheets: four items. Model a large folder label, a contents list and a “check needed” slip. State the intended user action: find the kit, check its contents and report a missing item. This creates a small prototype that can be tested before investing in a finished design.

The fictional test record says a user finds the folder and counts the items, but misses the slip instruction because it is on the reverse. Another user asks what to do with used sheets. Model three columns: observation, possible explanation and next check. Do not write “the user did not pay attention.” The design has hidden information and an unanswered process question.

The instructor clarifies that used sheets stay with the learner and two blanks are restocked. The kit also gains a second worked example, bringing it to five items. In CI-14, revise the visible instruction, mark the slip location, update the contents and identify Version 2. Ask why each change is needed. In CI-15, retest with a willing user and record support. A successful small test supports a limited claim about that trial, not a promise that the system works for everyone.

Build an environment where ideas can develop

The third strategy concerns a supportive and inclusive creative environment (p. 110). Provide time, materials, accessible participation routes and permission to offer an unfinished thought. Make feedback specific to the purpose. Ask what the author intended before recommending a change. Keep accurate source information fixed while allowing different ways to present it.

Discuss ownership before photographing, displaying, publishing or combining work. Learners may choose to keep an idea private. Nation-specific knowledge, imagery and teachings require guidance from the appropriate rights holders; a general invitation to be creative does not supply permission. CI-17 makes these boundaries

part of transfer to a fictional community-room or workplace task. The instructor should model asking whose approval a real change would require.

Assess process, product and contribution

The source recommends varied evidence and reflection (p. 111). Keep the design question, alternatives, comparison, prototype, test notes and revision. Assess whether the learner explored possibilities, developed details, used evidence and supported others. Fluency, flexibility, originality and elaboration can prompt discussion, but classroom observations are not standardized creativity-test scores. Avoid grading drawing polish, cultural expression or the number of ideas alone.

Increase complexity through more user needs, changing requirements, less obvious opportunities or a wider set of constraints. Offer a partially completed prototype or one-kit starting point when needed. Record the support and use another task to see what transfers. A plan for future use is valuable but remains a plan until an actual application is observed.

The source's three grab-and-go patterns are brainstorming in varied forms, working through an open problem with a creative-process diagram, and building a portfolio (p. 113). CI-05/CI-16, the full shelf sequence and CI-18 respectively retain those purposes. A portfolio should be shared by agreement. Preview the resource leads on p. 112 before using them; they are not independently verified recommendations in this chapter.

Sources and companion work: SkillPlan guide, pp. 106–113; Creativity and Innovation learner chapter; answer guidance.

Three complete lessons for the ACCESS IS4S learning room

These lessons rework the three appendix lesson purposes in the supplied SkillPlan guide: measurement, root-cause analysis and workplace email. Each includes the documents, practice questions, teaching sequence and answer guidance needed to begin. They are original ACCESS classroom designs. They can be used alongside the learner chapters or as a short integrated sequence.

Each lesson proposes 90 minutes. Check the actual pace with the cohort, arrange breaks according to the program's practice, and extend the sequence when learners need more time. The durations do not establish an official training requirement. Choose a manageable focus for observation even when the activity uses several skills.

The cases are fictional. No activity requires operating equipment, changing a workplace process, disclosing personal information, contacting an employer or sending an email. The purpose is to learn a method and show evidence of it. Transfer to a real task requires the relevant document, authorization and context.

Lesson 1: Measure, record and explain

Purpose: Use a ruler or tape to read a tabletop length, record its unit and explain a check. Connect fractional inches with metric measurement without silently mixing the systems.

Primary components: Numeracy 2, identifying mathematical information; Numeracy 4, applying operations and tools. **Supporting components:** Numeracy 5, interpreting and checking; Collaboration 1 and 5, working together and contributing to a common goal. Reading and Communication support the task, but a correct measurement does not automatically establish every reading or communication component.

A learner meets the core classroom outcome when they select the intended dimension, align and read an appropriate tool, record a value with a unit and explain a reasonable check. Record whether a partner or practitioner supplied any step. The paper exercise below can assess interpretation and calculation, but it cannot establish that someone physically used a measuring tool.

Prepare the task and the space

Provide a ruler marked in millimetres, a ruler or tape marked in sixteenths of an inch, pencils, the record table below and ordinary tabletop objects such as a notebook, a paper rectangle and a small empty box. Use items the instructor has checked for suitability. A stable desk is sufficient. Learners do not climb, reach above their comfortable range, extend a tape competitively, measure electrical equipment or measure another person's body.

A learner can choose a familiar safe object or use the supplied one. Record its identifier and dimension so another person knows what was measured. “Box: inside width” and “box: outside width” are different measurements. Decide which one the task requires before placing the tool. If two learners measure different

dimensions, their disagreement is not necessarily a calculation error.

Check starting knowledge with a short fraction comparison: which is larger, one-half or one-quarter, and how can you show it? Use a strip divided into equal parts if helpful. A learner who needs fraction instruction can begin with whole millimetres and supported inch markings, then return to the mixed-unit calculations later. The goal is meaningful practice, not rushing every learner through the same extension.

Ninety-minute teaching sequence

Minutes	Practitioner action	Learner evidence
0–5	Explain the purpose, tabletop boundaries, choices and focus components.	Learner identifies an object and dimension.
5–15	Review units, whole inches and equal fractional divisions.	Learner distinguishes unit, whole and fraction.
15–30	Model alignment, reading, recording and a second check.	Learner explains one decision from the demonstration.
30–50	Pairs measure three objects; rotate measurer and checker.	Each learner uses a tool and keeps an individual record.
50–65	Work through the supplied paper-data questions.	Labelled calculations and one estimate/check.
65–80	Compare records, investigate a disagreement and retry one measurement.	Evidence-based explanation and revised record if needed.
80–90	Give feedback and set an individual transfer task.	Learner names a strategy and a next use.

The intervals total 90 minutes: 5 + 10 + 15 + 20 + 15 + 15 + 10. Add a break or split delivery if appropriate; record the actual arrangement when comparing attempts.

Teaching passage: what a measurement says

A measurement describes a particular dimension using a particular unit and a tool with a particular resolution. It is not just a number. A record of “210” leaves the next person guessing whether the value is millimetres, centimetres or something else. “Notebook A, long edge, 210 mm, ruler marked in 1 mm divisions” tells another person what the record means.

The zero mark is the reference point for a direct length measurement. The physical edge of a ruler may not coincide with zero. Check the markings before using it. If the object begins at another mark, the length is the end reading minus the start reading. Do not report the end reading as the object's length unless the start really was zero.

An inch divided into 16 equal parts has marks one-sixteenth of an inch apart. Eight of those parts make one-half; four make one-quarter; two make one-eighth. The labels can change while the amount stays the same. Reducing 8/16 to 1/2 describes the same length more simply. Count intervals from the whole-inch mark rather than counting every visible line as a new whole unit.

A second measurement is useful when it checks the process. Repeating the same misalignment can produce the same wrong value. Ask the checker to inspect the selected dimension, the starting mark, the viewing position and the recorded unit. If a tool is unsuitable or the reading is unclear, state that limitation and ask for an appropriate tool. Confidence does not improve a tool's resolution.

Worked example 1: count the divisions

The end of a paper strip lies five small divisions beyond the 3-inch mark on a ruler divided into sixteenths. The whole part is 3 inches. Five divisions represent 5/16 inch. The length is therefore 3 5/16 in. As a reasonableness check, 5/16 is greater than 1/4 and less than 1/2, so the end should lie between 3 1/4 and 3 1/2 in.

Ask the learner to explain why 3.5 in is not the same answer: 3.5 in means 3 1/2 in, or 3 8/16 in. The decimal digit 5 does not mean “five small marks.” A diagram of a divided inch can support this explanation, but a printed diagram in this book is not a calibrated measuring tool.

Worked example 2: subtract the starting reading

A classroom strip starts at 1 in and ends at 6 3/8 in. Its length is 6 3/8−1 = 5 3/8 in. Check by adding the measured length to the start: 1 + 5 3/8 = 6 3/8 in. Recording 6 3/8 in would include the extra inch before the strip begins.

The same reasoning applies to metric readings. If the start is 20 mm and the end is 184 mm, the difference is 164 mm. Explain that the choice of a nonzero start is a classroom comparison, not a reason to ignore a damaged or unsuitable tool on a real job. Follow the actual workplace requirements for tools and measurement.

Worked example 3: connect the systems

One inch equals 25.4 mm exactly. A classroom length of 7.5 in therefore equals 7.5 × 25.4 = 190.5 mm. The unit changes; the length described does not. Check by dividing 190.5 by 25.4 to recover 7.5.

If a value is rounded to a tool's markings, record the rounding. A conversion may produce more digits than the original measurement can justify. Do not present an exact mathematical conversion as evidence that the original measurement was exact. For this lesson, the calculation demonstrates the relationship between units; the tool record still determines the observed precision.

Handout M1: individual measurement record

Measure three suitable tabletop objects. Record the actual values you observe; there is no predetermined answer for an object the instructor has not measured and identified. The second reading belongs to a real check, not a copied first answer.

Object ID and selected dimension	Tool/unit	First reading	Check reading	What explains any difference?
Object 1				
Object 2				
Object 3				

Each partner explains one measurement and one check. The observer records who selected the dimension, aligned the tool, interpreted the markings and explained the result. If one person did all the measuring, provide the other with a separate turn before recording tool-use evidence.

Handout M2: fixed paper practice

The values below are invented classroom data. Show working and units. Use the actual tool for M1; do not measure the printed numbers or page layout to answer M2.

ID	Question
M-01	A strip ends at 4 in plus 6 of 16 equal divisions. Write the length in simplest fractional form.
M-02	A second strip starts at 1 in and ends at 6 3/8 in. Find its length.
M-03	Add lengths 2 3/4 in and 1 5/8 in.
M-04	Find the difference between 5 3/8 in and 5 1/16 in.
M-05	A metric record begins at 20 mm and ends at 184 mm. Find the length.
M-06	Convert 7.5 in to millimetres using 1 in=25.4 mm.
M-07	Express 18 in as feet and inches using 12 in=1 ft.
M-08	A note says only “box width 210.” Identify two missing details before another person relies on it.
M-09	Two records say “outside width 205 mm” and “inside width 198 mm.” Explain why the numbers alone do not prove someone measured incorrectly.
M-10	Choose one answer and check it using a different operation or a useful estimate.

Answer guidance and observation

M-01:6/16 = 3/8, so 4 3/8 in. M-02:5 3/8 in. M-03:2 6/8 + 1 5/8 = 3 11/8 = 4 3/8 in. M-04:5 6/16−5 1/16 = 5/16 in. M-05:184−20 = 164 mm. M-06:190.5 mm. M-07:1 ft 6 in. For M-08, acceptable missing details include unit, object identifier, inside/outside dimension, method or tool resolution; at least unit and intended dimension should be clarified. M-09 compares different dimensions, so first establish whether the task and object are the same. M-10 can reverse an operation or bound an answer; simply rewriting the first calculation is not a different check.

For the practical record, look for a suitable tool, correct reference point, selected dimension, a readable value with a unit and an explanation of the check. Do not mark an unknown actual object against the fictional paper values. If a learner reports the wrong value, ask which mark and unit they used before deciding what to teach next.

Offer tactile or enlarged markings, a digital display where appropriate, a stable support surface, extra time or an instructor partner. Record the support. For remote delivery, use safe available tabletop objects and an appropriate local tool. If no tool is available, teach the paper interpretation and arrange a later practical turn. A photograph alone does not show all alignment actions.

The next task can ask the learner to use a different object or record template while retaining the checking routine. An estimate followed by measurement can extend the activity. Choosing an appropriate actual trade tolerance or judging a machine setting belongs to the relevant technical instruction and is not an outcome of this lesson.

Lesson 2: Investigate a problem before choosing a solution

Purpose: Distinguish a symptom, a possible cause and an evidenced explanation. Use a cause map and a short chain of “why” questions to choose a useful next check.

Primary component: Problem Solving 3, analyzing an issue. **Supporting components:** Problem Solving 1, 2, 4, 5 and 6 across the investigation cycle; Collaboration 2 and 3 through considering different views and discussing disagreement. The lesson extends the source appendix's analysis focus into a small classroom trial so learners can see how a proposed explanation is checked.

This lesson uses preparation of classroom learning packets. It does not investigate an actual incident, assign blame to a real person or authorize changes to a workplace process. If learners offer a real example, remove personal information and determine whether it is appropriate to discuss before using it. The supplied case is sufficient for every question.

Prepare the task

Give each group the case passage, production table, evidence cards and two templates below. Provide paper, markers or an accessible digital document. Groups need no machinery or accounts. Arrange roles such as evidence reader, questioner and recorder, then rotate them. Each learner keeps an individual problem statement and next-check explanation.

Explain that brainstorming produces possibilities, not findings. A fishbone-style cause map can organize possible contributing factors, but its shape does not prove a cause. Asking “why” five times is not a rule that makes the fifth answer true. Stop when the evidence runs out and name what must be checked. Several

conditions may contribute to the same result.

Ninety-minute teaching sequence

Minutes	Practitioner action	Learner evidence
0–10	Read the case; distinguish the desired outcome from the observed problem.	A neutral, measurable problem statement.
10–20	Model separating fact, inference and missing information.	One classified statement with a reason.
20–35	Teach a cause map and have groups organize hypotheses.	Several possible causes, each marked with evidence status.
35–50	Model a supported “why” chain and practise stopping at an unknown.	A chain with evidence references and a stopping question.
50–65	Compare actions and design a small classroom trial.	A chosen action, owner, measure and review point.
65–80	Reveal the follow-up data and interpret the result.	A checked comparison with a limitation.
80–90	Debrief interaction and complete an individual next-check note.	Each learner explains evidence, uncertainty and a next step.

The intervals total 90 minutes: 10 + 10 + 15 + 15 + 15 + 15 + 10. The follow-up data are a supplied simulation; the class is not expected to run three real production days during the lesson.

Case passage: the packet problem

> **Fictional training-room case**
>
> A learning team prepares 24 packets before each of three practice sessions. Every packet should contain the current version 3 information sheet and one classroom map. The checker records one primary defect for each packet that needs correction. For this exercise, an “old information sheet” and a “missing map” never refer to the same packet. This rule lets the team add the two counts without double-counting packets.
>
> Learners arriving at the room have sometimes received an old sheet or no map. The coordinator wants the team to understand the preparation process before proposing a change. A classmate suggests that the problem must be carelessness. Another suggests that the printer menu and mixed stacks may contribute. The team has not yet tested either explanation.
>
> The desired result is a complete packet with the current information. A useful investigation asks where the process can produce an old sheet or omit a map, which evidence supports each possibility and what a small test could show. No evidence in the packet establishes a person's motivation, cultural background or work ethic.

Handout P1: preparation counts

Run	Packets checked	Old information sheet	Missing map	Packets needing correction
A	24	6	2	8
B	24	4	0	4
C	24	0	3	3
Total	72	10	5	15

The table records the primary-defect categories defined in the case. It does not identify the cause of a defect. “Fifteen packets needed correction” is a finding from the table. “One person caused all fifteen defects” is an unsupported explanation.

Handout P2: evidence cards

E1 — Document register. Version 3 is marked current in the coordinator's register. Version 1 remains in a shared preparation folder with a similar filename. The register does not show who selected each file during the three runs.

E2 — Print-job record. The saved print queue contains two jobs labelled with the version 1 filename during runsA andB. The record supports checking file selection. It does not show which finished packet received which printed sheet.

E3 — Preparation-space observation. The current sheets, old sheets and maps were stored in adjacent unlabelled stacks before run A. After run B, the old stack was removed. Maps remained on a separate shelf during all three runs. The observation describes the setup; it does not establish every worker's actions.

E4 — Task instruction. The written instruction says, “Prepare 24 packets.” It does not name the current version, list the packet contents or identify a final checker. The coordinator confirms that no second written checklist was issued for these practice runs.

E5 — Team comments. One preparer reports choosing the first similarly named file. Another reports that a map stack was empty at one point. These are fictional reported observations to investigate. They are not independently verified records of every run.

E6 — Scope limit. The class has no information about the printer's internal condition, a real employer's process or an individual's personal circumstances. Equipment faults and personal explanations cannot be established from this case.

Worked example: separate evidence from a hypothesis

A learner writes, “The printer caused the problem.” Ask which record supports that conclusion. E2 shows jobs labelled with an old filename, which may reflect file selection rather than a printer fault. A more precise statement is: “An old file was available and appears in the print-job record. We should check how the current file is selected.” That statement preserves the evidence and identifies a useful next step without claiming more than the record supports.

The table also reveals two different defect types. Removing an old file may reduce outdated information while leaving missing maps unresolved. Keep the categories visible when designing the trial. A single total can hide whether the same problem is improving or one problem is replacing another.

Handout P3: cause map

Write the effect at the centre: “Packets require correction before use.” Place possible contributing factors under the categories below. A drawn fishbone, a table or a set of movable cards is acceptable; the evidence relationship matters more than the drawing style.

Category	Possible contributing condition	Evidence card	What remains unknown?
Information			
Process			
Tools and file access			
Materials and layout			
Coordination			
Another relevant category			

A completed example for Information is: “Instruction does not name current version; E4; unknown whether a verbal instruction supplied it.” Do not fill a category with an allegation merely because the table has a blank row. It is acceptable to say no evidence was supplied for that category.

Handout P4: a supported “why” chain

Link	Question and proposed explanation	Evidence	Continue or stop?
1	Why might an old sheet be available for a packet?		
2	Why might the old sheet be selected?		
3	What in the process could fail to catch that selection?		
4	What additional fact would we need before going further?		

A model chain begins with old printed material and a similarly named old file being available, supported by E1–E3. It then identifies an instruction that omits the current version and final check, supported by E4. It stops before asserting why a particular person acted as they did. A useful next inquiry is to observe the file-selection and packet-checking steps in a supervised classroom trial.

There is no requirement to produce exactly five causes. If the first link is uncertain, mark it uncertain rather than building four confident claims on top of it. Consider a second possible path when the evidence supports more than one explanation.

Handout P5: choose and evaluate a trial

Compare these classroom options: archive the old file and clearly name the current file; add a packet-content checklist and final check; buy a new printer immediately. Consider fit to evidence, effort, access needs and what can be learned. A practical trial might combine clear current-file identification with a simple content check while retaining separate counts for old sheets and missing maps.

Trial field	Learner plan
Specific change and reason	
Person responsible in the simulation	
What stays the same for comparison	
Counts or observations to collect	
Review point	
Result that would make us revise the plan	

Follow-up data — reveal after the trial plan: Three simulated follow-up runs each contain 24 packets. Their old-sheet counts are 0, 0, 0. Their missing-map counts are 1, 0, 2. The primary categories remain non-overlapping. Other conditions were not fully controlled.

Questions and answer guidance

P-01: Write a neutral problem statement. A suitable answer is, “Fifteen of 72 checked packets needed correction across three runs: 10 had an old sheet and 5 lacked a map.” This identifies a measured result without assigning motivation or a single cause.

P-02: Calculate the initial correction rate.15 ÷ 72 × 100 = 20.833…%, or about 20.8%. For run A alone, 8 ÷ 24 = 1/3, about 33.3%. The denominators describe different groups; do not use 72 for run A's rate.

P-03: Give two evidence-supported hypotheses. Examples include confusing file versions, mixed physical stacks or missing content/check instructions. Each should name a card and an uncertainty. “The team does not care” is unsupported.

P-04: Complete a cause map and a “why” chain. Accept different reasonable organizations if each claim's evidence and limits are visible. The model above is one valid path, not the only correct arrangement.

P-05: Select a trial. A clear file/version and content-check trial fits the supplied evidence better than buying a printer without evidence of a printer fault. A learner may propose another small test if its purpose, scope and expected evidence are explained.

P-06: Interpret the follow-up. There are 3 corrections among 72 packets: 3 ÷ 72 × 100≈4.2%. The difference from the initial rate is about 16.7 percentage points. The total fell from 15 to 3, a reduction of 12 packets; 12 ÷ 15 = 80% relative reduction. These describe the simulation. They do not prove the trial alone caused the change or that the issue is permanently solved. Old sheets were absent in the follow-up; missing maps remain a distinct issue to investigate.

P-07: Explain a next check. Observe map availability and the final contents check, retaining version and map counts separately. Compare additional similar runs before drawing a stronger conclusion.

P-08: Identify one contribution and one way the group considered another view. Observe actual interaction. A written claim of teamwork without an example is insufficient. Offer an individual instructor discussion when the group format did not permit a fair observation.

For a supported entry, provide two categories and one partially completed evidence row. For an extension, ask learners which additional data would distinguish two plausible explanations. In remote delivery, use shared accessible text or individual paper tables with an oral comparison. The problem-solving evidence remains distinct from skill in manipulating a diagram tool.

Lesson 3: Write a message the next person can act on

Purpose: Plan, draft and revise a useful workplace-style email. Choose clear language for the reader, preserve necessary facts and protect information that does not need to be shared.

Primary components: Writing 4 and 5, choosing suitable language/style and format. **Supporting components:** Writing 1, 2, 3 and 6 through identifying purpose, planning, using relevant words and revising; Digital 2 and 5 when learners actually use a tool and demonstrate relevant privacy decisions. A paper draft can demonstrate Writing but does not establish a learner's digital actions.

The source appendix uses a tourism employment context. This ACCESS version uses a training-room booking and handover. The writing process transfers to service, office, trades preparation and community work. It does not teach a fixed cultural rule for how every supervisor, client or community member should be addressed.

Prepare the task

Provide the case brief, message model, parts table, six practice prompts and review checklist below. Learners may draft on paper or in an accessible document. For digital practice, use a local draft document or a demonstration environment approved for the class. The addresses ending in `.invalid` are deliberately non-deliverable examples. Do not use real recipients, passwords or personal accounts, and do not send the classroom messages.

A learner can use a keyboard, speech-to-text or a scribe while retaining control of the wording and revision. Ask the learner to review the final text in an accessible format. A practitioner who writes the message for someone has provided support; the product alone should not be recorded as independent learner writing.

Ninety-minute teaching sequence

Minutes	Practitioner action	Learner evidence
0–10	Discuss purpose, reader, urgency and channel using supplied cases.	A reasoned choice of message purpose and channel.
10–20	Compare an unclear draft with the model and think aloud through the changes.	Learner identifies what helps the reader act.

Minutes	Practitioner action	Learner evidence
20–30	Identify message parts and separate necessary from optional content.	Labelled model and a privacy decision.
30–50	Practise clear requests and suitable register with the six prompts.	Revised sentences with audience/purpose reasons.
50–65	Draft a complete message from the case brief.	Learner-authored text with required facts.
65–80	Exchange a reader check, revise and verify source details.	A useful edit and checked final draft.
80–90	Review privacy/tool actions and plan a different future message.	Individual evidence and next practice goal.

The intervals total 90 minutes: 10 + 10 + 10 + 20 + 15 + 15 + 10. If digital setup takes longer, teach it separately or extend the session rather than treating tool difficulty as a writing result.

Teaching passage: make the purpose easy to find

A useful message helps the reader understand why you are writing, which facts matter and what action is needed. Respectful writing can be direct. It does not require a long introduction, elaborate vocabulary or a guessed title for the reader. Use the person's stated name or role and the conventions of the actual context.

The subject line should distinguish this message from others. “Room confirmation for Wednesday training” is easier to find than “Question.” Put the purpose near the beginning. Give the relevant date, time or reference. If the reader must answer a question, make that question visible. If several actions are required, a short list can help.

Tone depends on relationship, purpose and consequences. A familiar colleague may prefer a short message. A new external contact may need more context. Contractions are not automatically unprofessional, and a longer phrase is not automatically more respectful. Ask whether the wording is accurate, clear and appropriate for the actual reader. Do not grade a learner against an assumed accent, cultural style or preference for unnecessary formality.

A message also has a channel and timing. Email can provide a record, but the sender should not assume it is monitored continuously. For an urgent issue, use the organization's actual agreed contact process. A classroom discussion can identify that need without inventing an emergency procedure. Drafting a message is separate from deciding whether, when and to whom it should be sent.

Case brief: a training-room confirmation

> **Fictional case document — classroom use only**
>
> You are helping prepare a Wednesday learning session for 8 participants. The original booking lists Room 3, 9:00–10:30 a.m. A Monday message from the training coordinator says Room 5 may be available instead. You need confirmation of the room before the final notice is prepared.
>
> Ask the coordinator to confirm the room and the step-free route information by 3:00 p.m. Tuesday. Do not promise that a route is accessible before receiving the relevant information. The exercise does not supply a real building plan. The final learner notice will be prepared after the coordinator responds.
>
> The fictional coordinator's address is `coordinator@example.invalid`. Your practice sender name is “Training team.” One preparer suggests attaching a participant list containing personal telephone numbers, but the coordinator has not requested that list and it is not needed to answer this booking question.

The case supplies every fact needed for the draft. Learners do not have to disclose a disability, identify a classmate or describe a real accommodation. The purpose is to request relevant information while avoiding unnecessary personal detail.

Worked comparison: unclear draft and useful revision

Unclear draft: “Hi, are we moving? Everyone needs to know soon. I attached all the phone numbers. Let me know.”

The draft does not identify the session, time, proposed room or response deadline. It assumes the reader knows what “moving” means. The attachment adds personal information that the task does not need. The problem is not simply that the message is informal; it lacks information and makes an unnecessary disclosure.

Model revision:

> **To:** coordinator@example.invalid
>
> **Subject:** Confirm Wednesday room and route information
>
> Hello Training Coordinator,
>
> We are preparing Wednesday's 9:00–10:30 a.m. session for 8 participants. The original booking lists Room 3, and Monday's message mentions Room 5 as a possible alternative.
>
> Could you confirm the room and the step-free route information by 3:00 p.m. Tuesday? We will use your reply to prepare the final session notice.
>
> Thank you,
>
> Training team

This message names the purpose, gives relevant context and asks for a specific response. It does not state that Room 5 is confirmed or that the route meets every participant's needs. It omits the unnecessary contact list. An equally clear message can use different wording; do not require learners to reproduce the model sentence by sentence.

Handout E1: message parts and their jobs

Part	Job in the message	What to check
Recipient	Directs the message to the intended person or role.	Correct recipient and whether anyone else needs it.
Subject	Helps the reader identify and find the purpose.	Specific enough to distinguish the message.
Greeting	Opens the exchange appropriately.	Stated name or role; no guessed title.
Brief connection, if useful	Provides relevant context or acknowledges a previous exchange.	Optional; does not delay the important point.
Purpose and facts	Explains the reason for writing.	Correct session, dates, times, references and source status.
Request or action	Makes the next step visible.	Who should do what, by when if a real deadline applies.
Closing	Ends respectfully and may confirm the next step.	Does not make an unsupported promise.
Sign-off	Identifies the sender.	Suitable name or role; no unnecessary personal data.

The source guide presents eight common email parts. In this edition, a pleasantry is optional rather than a requirement for every message. The outcome is effective communication, not counting decorative sentences. A short urgent operational message may follow a different approved format; teach that format from the actual workplace source when relevant.

Handout E2: six practice prompts

For each prompt, write a useful one- or two-sentence message and explain one choice about audience, context or privacy. All situations are fictional.

E-01 — Request a document. You need the current classroom equipment-purpose sheet before Friday's practice. A folder contains two undated versions. Ask the instructor which version to use and where to find it. Do not claim that one is current merely because it appears first.

E-02 — Request another meeting time. A training discussion is offered at 2:00 p.m. Tuesday. You are available at 3:00 p.m. instead. Ask whether that alternative is possible. Do not write as if the time has already been changed.

E-03 — Correct a notice. You sent a practice notice saying Room 3. The coordinator has now confirmed Room 5; the date and time are unchanged. Draft a correction that names exactly what changed and avoids blaming another person.

E-04 — Explain an absence briefly. In the fictional case, you cannot attend tomorrow's classroom session. The program's exercise instruction is to tell the coordinator and ask how to obtain the missed materials. Write that message without inventing or disclosing medical or family details.

E-05 — Confirm a handover. You prepared 12 printed workbooks and placed them in the labelled classroom tray. Two additional copies are still needed. Tell the next preparer what is complete, what remains and where the material is located. Do not imply the set is complete.

E-06 — Respond to a scheduling mistake. A fictional visitor received an incorrect start time. The confirmed start is 10:00 a.m., not 9:30 a.m. Write a brief acknowledgement, correction and offer to clarify. Avoid promising that no scheduling error will ever happen again.

Handout E3: plan and reader check

Before drafting the full case email, fill four fields: reader; purpose; necessary facts; requested next step. Then draft without copying the model. When ready, give the text to a partner or instructor for a reader check. The reader should answer these questions from the text itself:

- Which session is the message about?
- What is confirmed and what remains uncertain?
- What response is requested, and by when?
- Is any information included that the reader does not need?

The author then checks names, times and source status against the brief. Keep a first draft and a revision, or mark the change in a way that preserves the earlier wording. A useful edit might add the response deadline, remove an unsupported room claim or omit an unnecessary attachment. Changing a font alone does not meet the intended writing-revision outcome.

Answer guidance

For E-01, a suitable response asks the instructor to identify the current version and its location before Friday. The wording should acknowledge that the two available versions are undated. For E-02, an appropriate request is, “Would 3:00 p.m. Tuesday work for our training discussion instead of 2:00 p.m.? Please let me know whether that change is possible.” It requests rather than assumes agreement.

For E-03, an acceptable correction is, “Correction to Wednesday's notice: the session will be in Room 5. The date and times are unchanged. Please use this correction with the earlier notice.” Add exact times if they are supplied in the exercise being used. Do not invent them in a standalone version of the prompt.

For E-04, “I cannot attend tomorrow's classroom session. Please let me know how I can obtain the missed materials and arrange any needed follow-up” meets the task without personal detail. It does not replace a real program's absence procedure; that procedure would need to be supplied for a workplace or program-specific assessment.

For E-05, the message should state 12 complete workbooks, their labelled-tray location and 2 copies remaining. If the learner calculates a complete set, 14 copies is the implied target, but the writer should still make the unfinished portion explicit. For E-06, a model is, “I sent an incorrect start time in the earlier message.

The confirmed start is 10:00 a.m., not 9:30 a.m. Thank you for checking; please let me know if any part of the arrangement needs clarification." Other respectful wording is acceptable.

For the complete case email, assess accurate session details, distinction between possible and confirmed room, specific request, Tuesday 3:00 p.m. deadline, relevant route-information request and absence of unnecessary personal data. Record a meaningful revision after the reader check. Assess grammar and punctuation where they affect meaning, and select a manageable next teaching focus.

If Digital is observed, record the learner's actual tool actions: create or open the draft, edit it, save it under a meaningful name and retrieve it. Observe the privacy decision rather than assuming it occurred because the final message contains no attachment. A paper discussion of privacy can show understanding, but it does not establish every online safety behaviour or digital component.

For supported delivery, provide the four-field plan and a sentence starter while retaining learner choice over wording. For an extension, ask for a concise text-message version for an approved fictional channel and explain what changes. In virtual delivery, share only the practice text. Learners can provide peer feedback in a locally approved space, with permission, without posting personal messages publicly.

Follow the evidence into the next lesson

After each lesson, identify one skill-specific next step and one transfer opportunity. A learner may need another unit-selection task, another example distinguishing evidence from inference, or another request written for a different reader. Retain the relevant support information so the next practitioner does not misinterpret a supported success as an unsupported one.

Use the nine-skills chapters for deeper instruction. These three lessons illustrate integration; they do not replace the complete component coverage in those chapters. A learner's portfolio can include a checked measurement record, an evidence-based problem statement and trial plan, and a revised message. Add individual observations of interaction and tool use where those skills were actually performed.

A practical review conversation asks: What did you do? Which evidence supports your answer? What changed after checking? What will you try next? These questions keep the focus on purposeful work, observable learning and a next opportunity rather than on a single global score.

Source connection and deliberate changes

The three lesson purposes come from SkillPlan's supplied guide: measurement 115–121, root-cause analysis 122–127, and workplace email 128–135. The new passages, data, templates, timings and answer guidance are original ACCESS curriculum drafts.

The measurement lesson uses safe tabletop tasks and omits the source's tape-extension contest and high or difficult-to-reach measurement suggestions. The analysis lesson treats causes as hypotheses to test and avoids presenting the fifth "why" as proof. The email lesson uses non-deliverable examples, requires no real account or sending, treats privacy explicitly and makes formal language a contextual choice rather than a rigid rule. These changes preserve the learning purposes while making the material usable in this program's classroom context.

Develop your practice and improve the program

Professional learning is most useful when it changes something learners can experience. Choose a specific teaching decision, try an improvement, examine the evidence and decide what to keep. Reading another resource can help, but the result should reach the lesson: a clearer model, a more accessible document, a better question, fairer observation or a more useful next attempt.

SkillPlan's guide closes with professional-development opportunities on pp.136–138 and a bibliography on pp.139–148. The opportunities are informational leads, not endorsements, and describe the landscape at the time of the March 2024 revision. This chapter turns that closing material into an original growth and review process. It distinguishes the supplied guide, resources independently retrieved for this edition and references whose contents have not been independently reviewed. [S1]

Start with a teaching question you can investigate

Use one recent activity as a starting point. Ask what learners were meant to do, what you explicitly taught and what the evidence showed. A broad concern such as "learners lack confidence with numbers" is difficult to act on. A narrower question is useful: "When calculating a part of a total, are learners choosing the correct whole, or are they copying the nearest number?" The next lesson can make that choice visible.

Self-assess across the work you actually do. Can you explain the focus skill? Select or create a suitable document? Model a strategy aloud? Offer accessible practice? Distinguish individual evidence from a group product? Give feedback that names an action? Record the limits of an observation? Select one priority rather than scoring yourself on everything. SkillPlan identifies its Practitioner Competency Framework as a resource for self-assessment and growth planning on p.21; its full website was not independently reviewed for this chapter.

Invite a colleague to help examine the question. They may notice an instruction you have stopped hearing because you know the intended answer. A learner may reveal that an unfamiliar abbreviation, small type or unclear file location prevented an otherwise manageable task. Treat that information as evidence about the teaching conditions. It does not automatically establish a skill difficulty.

A four-week growth plan

This is a suggested local cycle, not a required course or certification schedule. Adjust it to the program's timetable.

Stage	Practitioner action	Product to keep	Review question
Week 1: define	Select one skill outcome and examine two or three recent, appropriately handled examples of work. Note the task and support conditions.	One question, a baseline observation and a plan for evidence.	What exactly needs to become clearer?

Stage	Practitioner action	Product to keep	Review question
Week 2: prepare	Read the relevant source section, revise one model or scaffold, and rehearse with a colleague.	A revised task and a short explanation of the change.	Does the model show the thinking learners need?
Week 3: try	Teach the revised activity and observe individual attempts. Ask learners which part helped or remained unclear.	Work samples or observation notes, support records and learner feedback.	What changed in the observed action?
Week 4: decide	Compare evidence cautiously, identify remaining barriers and revise the next lesson.	A keep/change/try-next note with reasons.	Is the improvement useful enough to continue testing?

For example, a practitioner might replace “work out the percentage” with a model that first identifies the part, the whole and their units. In the next activity, learners select and label those quantities before calculating. If the selection improves, retain the strategy and try a different context. Do not conclude that the small local change proves an intervention’s effectiveness for all adults or establishes a national proficiency gain.

Keep the growth plan short enough to use. Record a purpose, evidence, action, colleague support and review date. Include one condition you cannot solve alone, such as unreliable device access or insufficient time for individual observation. Professional learning includes requesting a program change when the obstacle is organizational.

Coach with evidence and rehearse together

A useful peer observation begins before the session. Agree one question and the evidence the observer should collect. “Watch whether each learner gets a chance to explain their calculation” is more actionable than “tell me if the lesson is good.” Tell the group why a colleague is present and follow the program’s actual arrangements for observation and information handling. Avoid recording identifiable work or audio merely because the technology makes it easy.

During the session, the observer notes actions and conditions: the prompt given, the learner’s response, any assistance and the next step. Separate these from interpretation. “The instructor supplied the denominator after a pause” is an observation. “The learner cannot understand percentages” is an unsupported generalization from that moment.

Afterwards, let the practitioner describe what they noticed first. Compare notes, examine one example and identify one change. The conversation should result in a revised prompt, model or observation opportunity. A respectful review can still be precise: “The group reached the correct total, but we did not see who selected the operation. Next time, ask each person to record a choice before discussion.”

Use a brief rehearsal when a strategy is unfamiliar. One colleague teaches a two-minute model; another takes the learner role and asks a plausible clarification. Pause at the point where the explanation becomes vague. Try again with fewer assumptions or a visible example. Rehearsal is particularly useful for check-back routines, explaining a changed brief, teaching a file-save process and responding to a disagreement without taking over the decision.

Compare feedback judgements

Bring an anonymized or consented example and the stated success criterion to a team meeting. Each practitioner first records a judgement independently, using the four local feedback statuses: **Not observed**, **Not yet demonstrated**, **Demonstrated with support**, or **Demonstrated independently**. Include the evidence and support conditions. Then compare the reasons, not just the labels.

If one practitioner marks a task independent and another marks it with support, check whether they understood the conditions the same way. An agreed calculator is different from a colleague choosing the formula. A learner-controlled assistive tool is different from someone else authoring the response. Clarify the criterion and record the decision for future use. These discussions improve consistency; they do not turn the local record into a standardized assessment.

Pilot a lesson before widening its use

A pilot should answer practical questions about the lesson. Can learners understand the purpose? Are the documents readable and complete? Does the timing allow a model, practice and an individual attempt? Are the proposed criteria actually observable? Can people participate without unnecessary personal disclosure? Does the feedback lead to a useful next action?

Use a small, purposeful set of evidence rather than collecting everything. Retain the version of the task, planned and actual timing, any ambiguous instructions, individual evidence against the focus criterion, supports used, and optional learner comments. Record missing observations as missing. If a device failed, the task may need another opportunity; that event alone is not evidence of poor Digital skill.

Pilot question	Evidence to collect	Decision it can support
Was the task accessible?	Learner comments and observed barriers in print, language, tools or instructions.	Change format, clarify wording or arrange a support.
Was the focus skill taught?	The model used and the strategy learners tried.	Improve the explanation or guided practice.
Was the evidence individual?	A response, product or observed turn for each learner.	Add a short individual attempt or change group roles.
Did feedback help?	A first attempt, the feedback and a later attempt where available.	Keep or revise the feedback prompt.
Was transfer observed?	A separate later task in a different relevant context.	Record a specific transfer example or plan another opportunity.

Do not use satisfaction as a substitute for learning evidence. A learner can enjoy a session and still need practice; a demanding session can be useful and still need better access. Invite feedback in more than one way, including a private or brief written option where feasible. Ask concrete questions such as “Which instruction needed another explanation?” rather than requiring a public personal evaluation.

Discuss the pilot with the delivery team and, where appropriate arrangements exist, local partners. Agree what to change, who will do it and when the new version will be used. Keep a version note so an answer guide does not drift away from its learner activity. Describe findings as observations from this pilot, with the number and

nature of opportunities where relevant. Do not present invented sample results as completed evaluation.

Choose professional learning for the next task

The supplied guide lists AWES practitioner training, Bow Valley College's TOWES development and administrator training, Douglas programs, SkillPlan workshops and Workplace Education Manitoba's practitioner certification on pp.136–138. These are useful leads to investigate. This edition has not independently verified current admission requirements, dates, costs, delivery modes or certification conditions for those programs. An entry in the March 2024 guide is not a current offer. [S1]

One directly relevant resource was independently retrieved: Douglas College's **Indigenous Skills for Success Journey, Planting the Seeds for Growth**. Its current landing page identifies a practitioner train-the-trainer course and links learning tools for all nine skills. Its Facilitation Guide discusses connecting learning to participants' own contexts and values, individual journeys and varied delivery formats. The page states that credit toward Douglas's practitioner program depends on taking the course with a certified instructor; simply reading our textbook does not meet that condition. [S2]

BCIT's **Indigenous Guides** page provides another route for professional learning. It links the BCcampus Pulling Together series for different institutional roles and identifies Indigenous leadership in its development, including FNESC, IAHLA and Métis Nation BC. The linked books themselves were not retrieved during this research, so their specific guidance and licences remain to be checked before use. The page verifies a resource pathway, not those organizations' endorsement of this guide. [S3]

Choose a resource to answer the growth-plan question. If you need better individual evidence, prioritize assessment learning. If authentic documents are difficult to teach, investigate document use and complexity. If a lesson's context is culturally inappropriate, involve the right local expertise and examine the design process; a generic online course cannot replace that relationship. Allow time to apply and review what you learn.

Verify a resource before relying on it

SkillPlan's bibliography is a map of its sources. It includes books, articles, institutional guidance, tools and practitioner websites across all nine skills. Reading the bibliography does not mean reading those sources. Describe a resource as "listed in SkillPlan's guide" until you have retrieved and examined it yourself. This applies to the SRDC reports, *Controlling Complexity*, the Reader's Guide, research articles and culturally responsive teaching leads listed in pp.139–148. [S1]

Use a source record with the following fields:

- Title, author or publisher, edition or date, and the exact URL or supplied file.
- Date checked and what was actually accessible: full text, selected pages, abstract, search result, or blocked page.
- The specific claim or teaching decision it supports, with page or section.
- Context and limits: adult population, sector, country, age group or conditions that affect relevance.
- Copyright or licence terms observed, and the intended use of the material.
- A next action when a claim, permission or current version remains unresolved.

A search result is a lead, not evidence of a whole document. A webpage that returns a loading screen or robot challenge has not supplied the promised content. A publicly downloadable PDF is not automatically available for adaptation. The Douglas Facilitation Guide, for example, explicitly uses CC BY-NC-ND 4.0; its activities should not be remixed into this original resource without the required permission. JIBC's engagement guidance is all rights reserved and is cited through concise paraphrase rather than bundled or reproduced. [S2; S4]

For cultural knowledge, ask who can authorize the intended use and what can be shared beyond the original setting. Agree attribution, review, distribution and compensation before recording or incorporating a contribution. A source list does not establish those agreements. Keep local review and the status of unresolved resources visible to the team, so later editions can improve the work without inventing authority.

Sources and status

S1. SkillPlan. *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp.136–148; growth-planning lead on p.21. The supplied pages were read. Bibliographic entries are not claimed as independently reviewed publications. The growth cycle, coaching prompts and pilot tables in this chapter are original instructional proposals.

S2. Douglas College. Indigenous Skills for Success Journey and Facilitation Guide, retrieved 23 October 2026; selected front matter and delivery guidance read, especially printed pp.1, 7–10 / PDF pp.2, 8–11. The entire course, interactive activities and certification arrangements were not reviewed.

S3. BCIT. Indigenous Guides, retrieved 23 October 2026. Linked BCcampus book contents were blocked and remain unverified here. The original FNESC First Peoples Principles of Learning page and IAHLA site were also inaccessible; no FPPL text or alignment is claimed from those blocked pages.

S4. Justice Institute of British Columbia. *Living Indigenization: Engagement Protocols & Guidelines*, ©2025; content credited to Heather Saranczak and Jason La Rochelle; retrieved 23 October 2026. Engagement principles paraphrased from printed pp.12–17 / PDF pp.7–9; rights statement on printed p.3 / PDF p.2. No PDF, artwork or cultural contribution is reproduced.

Answer guidance: Reading

Use with the Reading learner chapter. The cases are original simulations, not live services or operational documents. Accept accurate paraphrase, pointing to marked text, spoken explanation or another accessible response mode. A writing difficulty must not obscure demonstrated reading comprehension. Record reading supports; an answer obtained through text-to-speech is supported reading evidence rather than independent unaided decoding.

Give local feedback as **Not observed**, **Not yet demonstrated**, **Demonstrated with support** or **Demonstrated independently**. Distinguish a missing observation from an observed attempt that has not met the criterion. Record transfer separately. These activities have not been validated as an official proficiency assessment.

RD-01 • State the reading task

Two suitable goals are “Find the first arrival/check-in location” and “Determine whether attendance after 11:30 is required.” Evidence: Arrival directs learners to reception beside the main entrance; Changes says the required introductory session ends at 11:30 and the resource table is optional. The afternoon session is for a different group. A response that chooses Room 2 as the *first* destination overlooks reception.

Look for the purpose and the supporting location in the document, not only a correct remembered place. A learner may mark each paragraph and explain the decision rather than copy it.

RD-02 • Preview before you search

Audience: people attending the introductory classroom visit. Purpose: explain arrival, materials, activities and changes for that visit. Version: 2, issued for Practice Day 1, replacing the earlier Room 3 draft. Useful features include descriptive headings, time table, audience statement and version/replacement information.

A reasonable sequence is skim for the overall visit; scan the table for break time, 10:10–10:20; close-read What to bring to determine that a phone is optional and shared device access is planned. Scanning can locate “phone,” but the surrounding sentence must be read to determine the condition. Do not treat the strategies as mutually exclusive when a learner explains a useful combination.

RD-03 • Build useful vocabulary

Optional: a choice rather than a required activity; supported by the resource-table paragraph. **Replaces:** takes the place of the previous instruction; version 2 names Room 2 instead of the earlier Room 3 draft. **Temporary:** used for the immediate classroom arrangement rather than presented as a permanent identity record; supported by reception providing a classroom label. **Applies:** is relevant to the particular group or situation; the final sentence directs readers to clarify which version is for their group.

A valid new example is “The extra practice table is optional, so I can choose whether to attend.” Look for accurate use and an evidence-based meaning. A dictionary definition alone is insufficient if the learner cannot connect it to this case. Optional language comparisons need not be shared or assessed for cultural authority.

RD-04 • Scan accurately

A1 leaves Cedar at 08:05 and arrives Northside at 08:35. B3 leaves Market at 08:32. Its dashes mean that the Cedar-departure and Market-arrival fields do not apply to that second-leg service. The legend expressly says a dash is not a cancellation.

Observe the learner moving across the correct row and using column headings. Confusing A1 with the unit title or reading a time from a neighboring row calls for row-tracking practice, not an assumption of weak number knowledge.

RD-05 • Read the condition

The first service must arrive **at least five minutes** before the second departs. B1 arrives at 08:25; B2 leaves at 08:28, allowing three minutes. It does not meet the condition even though arrival is before departure. B3 leaves at 08:32, allowing seven minutes, so B1–B3 is a usable connection in this fictional planner.

A complete answer identifies the five-minute rule, compares the actual gap and selects B3. Do not reward “it probably works” based on personal travel experience; the task defines the condition to apply.

RD-06 • Choose with evidence

Two eligible journeys are:

Journey	Northside arrival	Reception allowance	Reception time	Meets 08:55?
A1 direct	08:35	5 minutes	08:40	Yes
B1 then B3	08:47	5 minutes	08:52	Yes

B1–B3 also meets the seven-minute connection gap. One difference is that A1 is direct and reaches reception earlier, while B1–B3 starts at Cedar five minutes later and requires a connection. Neither is declared best for every person.

With a ten-minute reception allowance, A1 reaches reception at 08:45 and still qualifies; B1–B3 reaches reception at 08:57 and does not. A2 remains too late. Look for the changed assumption being applied consistently, not simply choosing the same answer again.

RD-07 • Follow the role, not the familiar name

The Town of Willow Reach owns the route. Pathway Paving carries out the contracted work. Ownership questions go to the Town's project contact; questions about the contractor's classroom display go to Pathway's training contact. The first and third paragraphs establish these roles and contacts.

The funding amounts are contributions to the practice plan, not a revenue-and-cost statement for the contractor. No profit can be calculated from them. The criterion is using the stated role, not treating the most familiar organization name as the answer to every question.

RD-08 • Separate evidence from assumption

- Different Town/contractor roles: **stated**, explicitly explained in the first paragraph.
- More than one funding contributor: **supported inference** from the three named contributions. Accept "stated through the list" if the learner identifies the three entries and explains the count.
- Contractor owns the road: **contradicted** by the brief's assignment of ownership to the Town and its distinction between owner and contractor.
- Construction begins next Monday: **not established**. A current applicable project schedule or start notice is missing.
- Brief can decide legal permits: **contradicted** by its explicit scope limits and lack of legal permissions/current applicable documents.

The key distinction is between a claim the source conflicts with and a claim for which the source gives no answer. Do not demand an unsupported construction date as a replacement.

RD-09 • Use both forms of the message

Both forms show the Town as owner and Pathway as contractor. The paragraphs more clearly identify the two question contacts, distinguish missing schedules/permissions or explain that funding does not establish profit. Neither supplies a construction start date, real permit list or actual operating plan.

A reasonable choice uses the diagram for the basic relationship and the paragraphs for the detailed responsibility/contact question. A learner may choose differently if they show that their selected form contains the needed detail. "I like pictures" alone does not demonstrate matching form to the information task.

RD-10 • Judge what a claim can support

D1 claims that proximity proves asphalt is **always** environmentally preferable to concrete. Problems include an absolute conclusion without a defined comparison, no author/date/source, no quantities or method and a statement discouraging comparison. Any two explained weaknesses meet that part of the task.

D2 supports only the fictional source-route comparison: 20 km versus 50 km, with the first route 30 km shorter one way. It does not establish total vehicle travel, emissions or overall environmental impact. Missing information can include comparable service requirements, material quantities, trips, loads, production impacts, maintenance and design life. Naming its limits makes D2 useful for identifying the next research questions; it does not make its invented figures real-world evidence.

RD-11 • Inspect a source record

Record Y supports identifying the purpose of this workbook's introductory card activity because its title, creator/context and limits match that task. Record X is too poorly identified to establish its intended use. Neither record authorizes operating equipment. Y explicitly excludes operating instructions, and X lacks sufficient provenance and content.

Three suitable additional details include the issuing organization, exact title/model applicability, current edition or revision date, complete relevant section, official source location and the task/site where it applies. Learners should request rather than invent these details. A professional-looking screenshot is not a substitute for source identification.

RD-12 • Apply a precise update

Only the 10:20–11:30 practice/review row changes from Room 2 to Room 4. Check-in remains at reception. The 09:00–10:10 welcome remains in Room 2. Break and optional resource-table entries are not changed by the update. The learner should not infer an alteration to them.

“All day in Room 4” is inaccurate because the update explicitly preserves the earlier welcome location and reception check-in. Evidence includes the matching group, Practice Day 1 and explicit reference to Welcome Note version 2.

RD-13 • Read for audience and purpose

Audience: learners borrowing practice resources during the classroom block. Purpose: help them identify available items and follow the classroom loan process. Helpful features include status definitions, item codes, a short sequence and a current-status table. Matters outside scope include a public library account, charges and a promised return time for an item already in use.

Learning IDs tell readers what information the activity needs and avoid putting personal details on the sheet. The explanation belongs because borrowing involves identifying both item and learner. A response should connect the privacy choice to the document's task rather than guess at external law.

RD-14 • Apply the conditions

C04 and B16 are marked Available. The first learner gives both codes and their learning ID to the desk helper, who checks the current sheet and agrees the return point. The request fits one calculator and up to two books.

C05 is Reserved, so the guide does not establish immediate availability for the second learner. They should ask the helper whether and when a suitable large-display option can be provided. C04 must not be assumed suitable merely because it is available. The source establishes status and process, not the learner's individual access requirements or future availability.

RD-15 • Notice what a summary loses

The sign wrongly suggests any calculator is immediately borrowable; it omits the status/current-sheet check. “Two books” loses the “up to” limit and could sound like a requirement. “Your details” is broader and less precise than the required learning ID. It also omits item codes and the agreed return point. Any three accurately explained differences are sufficient.

A corrected sign should retain availability checking, the one-calculator/up-to-two-books limits, item codes, learning ID and desk-helper agreement. The task assesses recognition of lost meaning; a polished rewritten sign is optional.

RD-16 • Independent transfer

For ten people meeting 14:00–14:45, Room West fits the group and time. Setup is 13:50–14:00, inside its 13:30–15:00 availability. Room East holds only eight and is unsuitable regardless of time. The remaining action is to ask the desk to confirm a booking; the note alone is not a reservation.

For a 13:30 meeting, setup would start at 13:20, before West is available. East still fails the capacity requirement. Neither listed room meets all conditions. Ask about another room or revised time rather than silently dropping the setup requirement. The source does not guarantee an alternative.

RD-17 • Show your reading route

Observe a new question, a stated information need, a relevant search route, a condition check where applicable and an evidence-based answer. Example: “Can I begin without a phone?” → What to bring → phone optional/shared device available → yes for this classroom activity. Another valid question, “When will B12 return?” should lead to “not provided,” because document E makes no return-time promise.

Both partners need an observed reading turn. A partner who supplies the answer before the learner searches changes the evidence to supported work. Keep the question and marked source rather than inferring independent reading from a fluent spoken answer.

RD-18 • Compare and reflect

D1 aims to persuade a prospective chooser through an absolute claim and a message discouraging comparison. E aims to help classroom borrowers complete a process through definitions, limits and a status table. D1 lacks supporting methods/data; E supplies information sufficient for the limited borrowing scenario while acknowledging missing future availability.

A useful reflection identifies a specific strategy and limit. Example: “Scanning found A2's 08:55 arrival, but I also had to read the paragraph to add reception time.” A suitable next goal is “I will check the legend and notes before deciding a timetable answer.” Avoid personality judgements or requiring a learner to disclose a difficult personal history. Reflection needs a link to actual documents and actions, not a generic claim to have improved.

Source alignment

The component structure follows the supplied SkillPlan guide, PDF/printed page 45. Pages 46–50 inform document features, explicit strategies and contextual vocabulary; page 51 informs assessment cautions; page 53 informs comparing purpose, structure and evidence. These answer models assess the original chapter cases only. All times, organizations and project records are fictional. They do not establish current transport, technical or regulatory requirements.

Answer guidance: Writing

These models answer the original fictional cases in the Writing chapter. Equivalent wording is welcome when it preserves the facts and serves the stated reader. Assess the learner's authored text, including text produced through an accessible tool or scribe under the learner's control. Record supports and review decisions. An oral explanation alone is not the writing product required here.

Use local feedback descriptions **Not observed**, **Not yet demonstrated**, **Demonstrated with support** and **Demonstrated independently**. Record transfer separately. Do not equate these descriptions with official proficiency levels or grade a learner's personality. Feedback should identify the specific change that would make the text more accurate or useful.

WR-01 • Define the writing task

A useful planning note is titled “Calculator request for Practice Thursday.” Reader: the resource desk helper. Purpose: request two extra calculators for the 09:00 session and obtain confirmation. Needed action: check the other classroom's availability and reply. Unconfirmed information: whether the extra calculators can be supplied or are booked.

The message does not need individual names or support histories; item, quantity, required time and return plan are sufficient for this task. Look for all four task elements plus a privacy/relevance sentence. “Tell everyone about the session” is too broad and identifies the wrong immediate audience.

WR-02 • Select the information

Include: two extra calculators; six total needed; four already available; session starts 09:00 Practice Thursday; paired activities; return by 11:45; request due before 15:00 Practice Wednesday; availability requires checking. Group size twelve is useful supporting context but need not dominate the message.

Leave out: tea preference, old blue labels and personal learner details. These do not help the helper decide whether the requested items can be lent. At least eight correctly sorted details and two reasons are required. A common error is requesting six *more* calculators rather than the two-item shortfall.

WR-03 • Organize before drafting

One valid plan:

- Subject: Two calculators requested for Practice Thursday.
- Request: Borrow two for a session beginning at 09:00.
- Context: Four on hand, six needed; instructor can return the two by 11:45.
- Confirmation: Can the desk supply two, after checking the other classroom booking?

The request deadline can be included as part of planning or the message's preparation timing. Do not invent a desk email address, delivery promise or booking reference. Look for an order that makes the helper's decision easy.

WR-04 • Write your request

Model:

> **Subject: Two calculators requested for Practice Thursday**
>
> Hello resource desk team. Could you check whether we can borrow two calculators for the introductory session starting at 09:00 on Practice Thursday? We have four calculators and need six for the paired activity. The instructor can return the two borrowed calculators to the desk by 11:45. I am preparing this request before the 15:00 Practice Wednesday deadline. Please confirm whether the loan is available so the instructor can finalize the activity. Thank you.

The model is within the suggested range. Required evidence is a clear extra quantity, time, return plan, intended recipient and confirmation question. “Could you check” and “please confirm” preserve the pending status. A message that states “our booking is confirmed” fails the factual criterion even if grammatically polished.

WR-05 • Repair ambiguity

One revision: “Could the resource desk check whether two extra calculators are available for the session starting at 09:00 on Practice Thursday? Four are already available, and six are needed in total. The instructor can return the borrowed calculators by 11:45. Please confirm availability; the loan has not yet been agreed.”

Useful explanations include replacing “them” with “two calculators,” replacing “before class” with the required time, replacing “six more” with the correct extra quantity and replacing “should be fine” with an explicit confirmation request. The learner should identify two misunderstandings prevented by their edits.

WR-06 • Change the reader

Model: “Our introductory session starts at 09:00 on Practice Thursday. Paper workbooks are supplied, and you do not need to bring a personal calculator. The instructor is arranging shared calculators and will adapt the activity if the additional loan is unavailable. We can begin the learning tasks on paper.”

The notice does not promise six secured calculators. The learners do not need the desk's request-processing deadline or the internal return arrangement to prepare for this activity. Accept 40–70 words with the supplied-paper and no-personal-calculator points. Do not add unsupplied arrival locations or equipment requirements.

WR-07 • Complete the form

Field	Suitable entry
Practice day	Practice Tuesday
Location	Northside resource desk
Item	Introductory workbooks, box 1 of 1
Receipt time	09:10
Quantity on note	24 copies
Quantity counted	22 copies
Count-check time	Independent recount at 09:15
Action already taken	Delivery note retained; 22 books placed together on resource shelf; instructor informed at 09:20
Information still missing	Order number, supplier contact name and explanation for difference not provided/confirmed
Requested follow-up	Resource coordinator to check the order and discrepancy

The box was received at 09:10, not recounted then. Short entries are appropriate if they preserve the facts. “Unknown” or “not provided in the case” is better than a fabricated order number.

WR-08 • Replace judgement with evidence

Model: “The delivery note listed 24 introductory workbooks, but the box contained 22 when counted. A second helper independently counted 22 at 09:15. The note was retained, the workbooks were put on the resource shelf and the instructor was informed at 09:20. Please ask the resource coordinator to check the order; the cause has not been confirmed.”

Remove “messed up again,” which asserts blame and a repeated pattern not supported by the case. The revision gives an investigator quantities, a check and a next action without requiring acceptance of an accusation. Accept three or four accurate sentences with these elements.

WR-09 • Write a short record for a handover

Model:

Introductory workbook delivery: quantity discrepancy

At 09:10 on Practice Tuesday, a sealed box arrived at the Northside resource desk. Its label read "Introductory workbooks, box 1 of 1," and the delivery note listed 24 copies. The first count found 22 workbooks. A second helper independently confirmed 22 copies at 09:15. The delivery note was retained, and the 22 workbooks were placed together on the resource shelf. The instructor was informed at 09:20. No explanation for the difference has been confirmed, and the case supplies no order number or supplier contact name.

Follow-up needed: Resource coordinator to check the order and the discrepancy before any replacement arrangement is described as confirmed.

This model contains about 120 words. Required elements include the two quantities, sequence/check, retained records, location of items, uncertainty and requested follow-up. The exact word count is a practice guide, not a reason to reward filler or reject a slightly different useful record.

WR-10 • Write an ordinary classroom procedure

One suitable sequence:

1. Choose an available practice item and note its code.
2. Give the code and your learning ID to the desk helper.
3. Ask the helper to check the current sheet and agree a return point.
4. Check that the recorded item and return point match the agreement.
5. Return the item to the helper at the agreed point.

Separate condition: "If the item is unavailable, ask the helper about a suitable alternative." All five steps must preserve the supplied order. Do not accept instructions to take a reserved item or invent a deposit, fine or identity-document requirement. The wording is classroom resource handling, not machine operation.

WR-11 • Turn notes into a readable table

Item code	Practice resource	Status in this exercise
C04	Basic calculator	Available
C05	Large-display calculator	Reserved
B12	Measurement practice book	In use
B16	Document-reading practice book	Available

Title example: "Classroom resources: practice status table." Note: "These statuses apply to this classroom exercise only. The helper checks the current sheet before agreeing to a loan." Codes identify items; status labels describe availability. Separate columns let the reader scan and compare without confusing one category with another. A table with accurate rows but no status limitation misses part of the task.

WR-12 • Write a visitor notice

Model:

> **Classroom display: From materials to a finished road**
>
> Visit our fictional project-learning display on Practice Friday, 13:00–13:40, in Room 2 at the Northside Learning Room. Check in at reception first. The display introduces the main paving stages and explains owner and contractor roles through an invented Willow Reach example. It is a classroom activity, not a real construction notice or worksite tour. Tools and personal devices are not needed; printed explanations are supplied. If you would like enlarged copies, ask the classroom coordinator by 15:00 on Practice Thursday. Bring your questions about the information a real project would need.

The model is within 90–130 words. Check purpose, day, exact time, room, reception-first direction, materials and request route/deadline. The classroom coordinator is the only supplied contact route; no fabricated address is needed.

WR-13 • Make the tone useful

An internal revision could say: “Could someone confirm responsibility for preparing the printed explanations for the Practice Friday display? The visit runs 13:00–13:40 in Room 2, and enlarged-copy requests are due to the classroom coordinator by 15:00 on Practice Thursday. Please confirm who will prepare the copies and whether any clarification is needed.”

The case has not assigned individual responsibilities or specified a number of copies, so those details cannot be supplied as facts. A visitor-facing opening might be “You are invited to our fictional project-learning display on Practice Friday.” Look for a change in purpose and audience, not merely replacing a rude word with a formal one. Do not assign tasks based on assumed cultural or personal roles.

WR-14 • Check against the source

Conflicts: end time 14:00 should be 13:40; Room 3 should be Room 2; first destination is reception, not straight to the room; a calculator is not required; enlarged-copy requests have a 15:00 Practice Thursday deadline; funding does not come entirely from the contractor.

A corrected version: “The fictional Willow Reach learning display runs 13:00–13:40 in Room 2 on Practice Friday. Check in at reception first. Tools and personal devices are not needed. Ask the classroom coordinator for enlarged copies by 15:00 on Practice Thursday. The invented $120,000 funding plan comprises $60,000 from the Town, $40,000 from Regional Access Fund and $20,000 from Community Route Fund.”

Learners must label at least the time correction, an arrival/materials/request correction and the funding correction. Correcting spelling while retaining any of those false facts does not satisfy the source-checking task.

WR-15 • Use reader feedback while keeping authorship

Collect the first notice, partner markings, revised notice and change note. The reader should locate the event time, reception-first instruction and enlarged-copy deadline. A useful change could move the arrival instruction beside the room or make “Practice Thursday” explicit in the deadline.

The author should check an important fact against case C. If it was already correct, record that verification rather than inventing an error to correct. Look for at least two purposeful review actions: one justified clarity improvement and one documented factual check. A learner may reject “remove fictional to save space” because it would misrepresent the case. Copying a partner's replacement text without reviewing its meaning weakens evidence of learner authorship.

WR-16 • Independent request and record

Model: “Hello desk coordinator. Could we reserve Room West on Practice Monday from 13:50 to 14:45 for ten learners? The meeting runs 14:00–14:45, with ten minutes beforehand to arrange paper resources. Room West's listed capacity and availability appear to fit these needs. We can restore the ordinary layout by the end of the requested booking. Please confirm whether the room can be reserved.”

Planning row: **Pending confirmation | Room West | Practice Monday | 10 learners | 13:50–14:45, including setup**. Room East's capacity of eight cannot meet a ten-person requirement. The request and table should agree and must not show “confirmed” without a reply. The case permits restoration by the booking's end; do not invent extra availability or a booking number.

WR-17 • Revise when the requirement changes

The new meeting is 13:30–14:15, requiring setup from 13:20. Room West becomes available only at 13:30, so it no longer meets the setup need. Room East still fails the ten-person capacity. Neither listed room satisfies all unchanged requirements.

Model follow-up: “Please update our pending Practice Monday request. The group now needs the 45-minute meeting to start at 13:30, with ten minutes of setup beforehand. This would require room access from 13:20 to 14:15. Room West is listed as available only from 13:30, and Room East holds fewer than our ten learners. Is another suitable room available, or should we discuss a different meeting time? Please treat the earlier 13:50–14:45 request as needing revision, not as a confirmed booking.”

Retain the first row or version and add a dated/practice-labelled change row with status “Revision requested; alternative pending.” A response that silently removes setup or reduces the group size changes the task without authority.

WR-18 • Show what changed in your writing

Require two actual pieces for different purposes or audiences, a writer's note for each and a before/after excerpt. Useful evidence might contrast the helper's calculator request with the learner notice, or the factual workbook record with the visitor invitation.

Model explanation: “I changed ‘six more’ to ‘two extra’ after checking the four already available. That prevents the helper arranging the wrong quantity.” Another is “I put the reception instruction beside the room so the visitor sees both before travelling through the building.” A concrete next goal is “I will mark whether a booking is pending or confirmed in both my message and table.” Generic self-praise or self-criticism does not replace text-based reflection.

Source alignment

The six components follow the supplied SkillPlan guide, PDF/printed page 54. Pages 55–58 inform forms, audience, context and an explicit writing process; page 59 informs feedback/assessment choices; page 61 informs message, record and procedure practice. All models here are original and answer the chapter's fictional information. They are not official employer forms or a validated writing proficiency test.

Answer guidance • Numeracy

Use the learner's method, units, interpretation and explanation alongside the final answer. These keys describe original fictional exercises. Accept a different valid method and record support used. Separate an observed attempt needing further practice from missing observation. The local feedback descriptions are **Not observed / Not yet demonstrated / Demonstrated with support / Demonstrated independently**; transfer is recorded separately, not used as a fifth status.

NU-01

A suitable task statement is: “Find a whole-pack supply order that meets the eighteen learners' requirements and the planned spares. Report pack counts and the complete dollar cost, including delivery, against the $65 budget.” Learner count, usable stock, pack prices and delivery conditions are needed now. The contractor name supplies background but does not determine quantities or prices. Permission to collect the order is not supplied. A response should not assume free collection to make the budget work. Look for the decision, an expected output and units, rather than an unexplained list of numbers.

NU-02

Item	Learner quantity	Spares	Target	Existing	Additional needed
Folders	18	2	20	7	13
Pens	36	4	40	9	31
Labels	54	6	60	16	44

Labels need the most pieces added. Learners connect the per-person requirement and learner count with the separate spare/stock information. Subtraction can be done in a different order if every requirement remains visible; the concern is omitting spares, not declaring a mathematically equivalent order invalid. For example, `18 − 7 + 2 = 13` is valid for folders. Ask the learner to explain how their working preserves the target.

NU-03

Pens: `18 × 2 = 36`; `36 + 4 = 40` target; `40 − 9 = 31` needed. `31 ÷ 12 = 2.5833…`, so three complete packs are required. Cost `3 × $6.60 = $19.80`. Quantity after purchase: `9 + 36 = 45`, which is five more than the target. Relative to the thirty-six pens allocated to learners, nine remain: four planned spares plus five additional pieces from whole-pack purchasing. A common error calls all nine “extra beyond the target”; require the learner to name which whole is being compared.

NU-04

Labels: target sixty, sixteen available, forty-four needed. `44 ÷ 20 = 2.2`, so three packs cost `3 × $4.20 = $12.60`. Final stock is `16 + 60 = 76`, sixteen beyond the target. Goods subtotal: `$26.25 + $19.80 + $12.60 = $58.65`. Because that is below $60, add $8.50 delivery: **$67.15**, exceeding $65 by **$2.15**. A suitable correction says the goods subtotal fits but the complete delivered order does not. Do not accept a change to an unstated rule, omitted spares or an invented discount. The later NU-17 activity explicitly introduces permission for an additional pack.

NU-05

Folders: `7/20 = 0.35 = 35%`. Pens: `9/40 = 0.225 = 22.5%`. Folder stock covers the larger share of its target even though there are fewer folders than pens. The wholes differ: twenty folders versus forty pens. Fraction strips can show seven of twenty and nine of forty; converting `7/20` to `14/40` also gives a direct comparison with `9/40`. An answer comparing only seven and nine does not address coverage. Accept exact fractions, decimals or a correctly labelled visual, with both required percentages reported.

NU-06

At twenty-two learners:

Item	Target including spares	Additional needed	Whole packs	Cost
Folders	24	17	4	$35.00
Pens	48	39	4	$26.40
Labels	72	56	3	$12.60

Subtotal **$74.00**, so delivery is free under the stated rule. Complete total **$74.00**, a **$9.00 shortfall** against the budget. Folder and pen pack counts increase from three to four; labels remain three packs. The revised total is $6.85 above version 1's delivered $67.15. A useful report asks the coordinator how to address the shortfall or revise authorized quantities/budget; it does not claim approval to overspend. Check that the learner retained the same spares and delivery condition.

NU-07

Choose service **A at 07:10**, arriving Central at 07:45, then **C at 08:00**, reaching Training Stop at 08:25. The walk ends at **08:33**, and the ten-minute buffer ends at **08:43**, two minutes before 08:45 registration. Service B reaches Central at 08:15 and cannot catch C. Connecting B to D reaches Training Stop at 08:50, the room at 08:58 and buffer end at 09:08. That misses registration. A learner choosing A plus D must also reject it as too late. The task requires an arrival constraint, not just a valid transfer.

NU-08

Central outward wait: `08:00 − 07:45 = 15 minutes`. Outward travel to room: thirty-five minutes on A, fifteen waiting, twenty-five on C, eight walking, for **83 minutes**, or **1 h 23 min**. Add the worked return total of ninety-five minutes: **178 minutes = 2 h 58 min** of combined outward-and-return journey time. This excludes all 27 minutes in the room from 08:33 to 09:00, including the planning buffer, and excludes the workshop itself. It is not the whole day's time outside the workshop. `83 ÷ 60 = 1.3833… decimal hours`; 1.83 hours would be 109.8 minutes, not eighty-three. Accept either a correct decimal explanation or the clearer `1 h 23 min` correction, with explicit distinction between base-sixty minutes and decimal hours.

NU-09

Four boardings cost `4 × $2.50 = $10.00`. The $8.00 pass saves **$2.00** for that four-boarding day, assuming all four are covered and no other charge applies. Two separate boardings cost **$5.00**, which is **$3.00 less** than the pass. “Always cheaper” is unsupported because the number of paid boardings changes the comparison. The pass becomes cheaper than separate boardings when four or more $2.50 boardings are covered within the same day. Learners need not generalize that threshold, but any extension must preserve the case conditions.

NU-10

With registration changed to 09:10, service **B 07:40–08:15** connects to **D 08:25–08:50**. Room arrival is **08:58**; buffer end is **09:08**, leaving a **two-minute margin** before registration. Four boardings still favour the **$8 pass** over $10. A model note identifies version 2, service letters, both arrival/buffer times and the margin. Real-world unknowns include current departure times, actual route availability, walking route/accessibility, fares and service disruptions. Do not treat the fictional timetable as confirmation of any actual trip.

NU-11

Width: **600 mm = 60 cm = 0.6 m**. Height: **400 mm = 40 cm = 0.4 m**. Gap: **20 mm = 2 cm**. A resized screen/print changes a drawing's physical dimensions, so the labelled values govern this calculation. For an actual sheet, record the measured value in millimetres, the rounding precision and how zero and the endpoint were aligned. There is no single required sheet measurement because the object is not specified. Accept only a plausible method linked to the actual object; do not invent a measurement for a learner who used the no-tool alternative. That alternative can establish conceptual alignment, not an observed physical measurement.

NU-12

Board perimeter: `2 × (0.6 + 0.4) = 2 m`. Board area: `0.6 × 0.4 = 0.24 m²`. One card: `0.18 × 0.11 = 0.0198 m²`. Four cards: **0.0792 m²**. Coverage: `0.0792 ÷ 0.24 × 100 = 33%`. Area describes surface coverage; perimeter describes boundary distance. A visual or numerical check shows four cards' area is about one third of the board, not more than the whole. Accept millimetre calculations converted correctly: 240,000 mm² and 79,200 mm². Watch for dividing square millimetres by one thousand instead of one million.

NU-13

Original inside dimensions are **550 × 350 mm**. Across: two cards require `2 × 180 + 20 = 380 mm`; three require `3 × 180 + 2 × 20 = 580 mm`, exceeding 550. Down: two cards require `2 × 110 + 20 = 240 mm`; three require `3 × 110 + 2 × 20 = 370 mm`, exceeding 350. The permitted grid therefore holds **2 × 2 = 4 cards**. More total area being available does not establish dimensional fit, particularly with fixed orientation and gaps. A valid sketch labels dimensions/margins/gaps without relying on its printed physical size. Do not silently rotate cards, as the brief fixes orientation.

NU-14

`6½ = 6.5`; `6.5 × 25.4 = 165.1 mm`. `¼ = 0.25`; `0.25 × 25.4 = 6.35 mm`. Using 25 instead of 25.4 would give 162.5 mm for the longer strip, 2.6 mm below the exact conversion of the supplied nominal length. It is an approximation because it substitutes a rounded factor. The conversion factor is exact; the precision of a real measured length would still depend on the measurement. Do not infer that a printed drawing is 165.1 mm long.

NU-15

Total visitors: `8 + 12 + 6 + 10 = 36`. Trades preparation: `12/36 = 1/3 = 33⅓%`; accept 33.3% or 33.33% when labelled rounded. The bar chart should use counts, zero to twelve in steps of two, four correctly labelled categories and heights 8, 12, 6 and 10. Include “fictional” in its title. Supported comparisons include Trades preparation having six more visitors than Service roles or Community project planning having two more than Orientation. Unsupported conclusions include actual B.C. demand, participants' reasons for attending, future enrolment or any demographic claim. Paper or digital charts can demonstrate this numeracy outcome; Digital requires separately observed tool use.

NU-16

New clear width: `600 − 10 − 10 = 580 mm`; height: `400 − 10 − 10 = 380 mm`. Three columns require **580 mm**, exactly the clear width. Three rows require **370 mm**, within 380. Four columns or rows do not fit. Capacity is **3 × 3 = 9 cards**, five more than the original four. All given dimensions are nominal, and the classroom result has no real installation tolerance claim. The response should name fixed orientation, 20 mm inter-card gaps and 10 mm outside margins. Increased area alone cannot show that lengths and gaps satisfy both dimensions.

NU-17

Original minimum-quantity goods subtotal **$58.65**, plus $8.50 delivery, equals **$67.15**. Add one permitted label pack at $4.20: goods become **$62.85**. That reaches the $60 threshold, so delivery is zero and the complete cost is **$62.85**. Saving compared with the original delivered order: `$67.15 − $62.85 = $4.30`. The revised order fits $65 with **$2.15 remaining** and adds twenty labels. The coordinator has supplied future use/storage permission in this activity; without that condition, “buy extra to save” would require a value/use decision rather than an automatic recommendation. A common error adds delivery again after crossing the threshold.

NU-18

Accept one of three handovers with its complete conditions:

- **Journey:** B then D, room 08:58, buffer ends 09:08, registration 09:10, four-boardings pass $8, with actual transport information still needing verification.
- **Board:** nine fixed-orientation cards in a 3 × 3 grid, 10 mm margins, 20 mm gaps, occupying 580 × 370 mm within 580 × 380 mm clear space; nominal classroom dimensions only.
- **Order:** version 1 quantities plus the specifically authorized extra label pack, total $62.85, $2.15 within budget and $4.30 below the original delivered total, with the extra labels intended for the next session.

Observe whether the handover states the question, inputs, method, check, result and consequence. Ask the listener to restate a key condition so the author can correct a misunderstanding. For reflection, accept a specific example such as catching the delivery charge, checking both margins, using the correct denominator or distinguishing 83 minutes from decimal hours. Do not score confidence, accent or personality as numeracy. A supported explanation can demonstrate understanding when its support is recorded.

Source note

This key applies to original classroom cases. The six-component structure comes from the supplied SkillPlan guide, PDF/printed page 62. The approach to contextual tasks, different methods and descriptive feedback draws on pages 64–67; measurement and graphic displays are discussed on page 70. These activities and local feedback descriptions are not a validated official numeracy-level assessment.

Answer guidance • Digital

Assess the stated action and its purpose. Record the learner's chosen access method and support. A paper answer can show understanding but cannot substitute for an unobserved device or online action. All records and messages in this chapter are fictional classroom material.

DG-01

The learner correctly distinguishes physical device, application and saved file, then demonstrates two usable controls. For example, selecting a word-processing application and entering a sentence establishes two actions; merely naming a laptop does not. Accept voice, switch, keyboard, touch or other supported input. Speed and using a particular brand's terminology are not criteria.

DG-02

Look for prediction, a demonstrated adjustment, a test and a recovery/permission plan. Example: “I enlarged the text, checked that the heading and table remain visible, and can return the zoom to its previous setting.” Do not require learners to explain medical or personal reasons. A change that makes content harder to use can still support learning when the learner notices and revises it.

DG-03

Evidence includes the named practice folder, a document containing the date and meaningful goal, saved location, and successful close/reopen. In an autosave tool, accept checking the recorded location and latest content. A screenshot of a typed sentence without finding the saved file leaves retrieval unobserved.

DG-04

A reasonable choice is word processor for the visitor note, spreadsheet for the changing count record, and presentation tool for a three-screen explanation. Other choices are valid if the learner explains suitable features and limitations. For example, a word-processing table can display counts but usually requires a separate plan for recalculation. “It is the only accessible tool here” is a meaningful constraint when the learner explains the workaround.

DG-05

Rows must match the supplied source. Remaining sets are Material flow 3, Equipment purposes 2, Road users 3. Totals: prepared `8 + 6 + 10 = 24`; checked `5 + 4 + 7 = 16`; remaining `3 + 2 + 3 = 8`. The relation `24 − 16 = 8` is a useful independent check. Inspect a formula's range or the alternative calculation. Check headings, fictional-data label, editable saved file and the distinction between prepared and reviewed classroom cards.

DG-06

Only the Road users checked value becomes 9. Prepared total stays 24. Checked total is `5 + 4 + 9 = 18`; remaining rows are 3, 2 and 1, totalling 6. The check is `24 − 18 = 6`. The record should identify the update and current version without pretending a technical inspection occurred. Retaining both versions supports comparison; it is not a universal retention policy.

DG-07

Notice A lacks provider, intake, date, eligibility, credential definition and a verification route. Its universal qualification and free-training claims are unsupported. Notice B identifies a limited purpose and some questions to confirm, but remains fictional. A useful rewritten question is: “What does attendance complete, and which credential, if any, is awarded after which requirements?” Do not award a claim that B proves a real opportunity because it looks more careful.

DG-08

The learner finds and opens the second record, checks Road users=9 and records its actual name/location. The route may use a folder, search or accessible file navigation. The key is content verification. A file called “v02” containing the older values does not satisfy the task.

DG-09

A complete source record names the document/page, publisher, version or honestly missing date, location, specific supported fact and a boundary. Example: a supplied historical outline supports the wording of A1 in that version; it does not establish a current intake date. A quotation should be marked as such; a paraphrase should preserve the claim without implying extra authority.

DG-10

Observe actual online access and navigation, the correct public publisher/title/address, location of Digital information and a dated route record. Accept changed page structures with a justified official equivalent. If the environment blocks the site, do not assess that as learner failure. Mark online navigation not observed, retain content work and schedule another opportunity.

DG-11

The record should show a relevant query, actual selected official page, publisher/topic comparison and a reasoned selection. Rejection of another result must refer to relevance, authority or information limits rather than appearance alone. If no second result is available, accept an explanation of what independent or complementary evidence would add; do not invent a search result.

DG-12

A usable instruction gives a starting point, steps, target information and a verification check. Observe the partner's test and a justified revision. For example, replace “click here” with the actual current heading. Distinguish the author's document work from the reader's online turn. No email or public post is required.

DG-13

Relevant concerns include manufactured urgency, password request, identity-document request, mismatched sender address, unfamiliar link, discouraging independent contact and no course reference. A sound sequence is pause; avoid replying/clicking/submitting; preserve only the information needed for the instructor's review; verify through the known office route; follow the authorized reporting process. A short practice report could say: “This message requests credentials and identity information, uses a ten-minute deadline and does not match our contact sheet. I have not opened its form. Please help verify it through the established contact.”

DG-14

The review copy should retain useful headings/counts and the fictional-data label while removing the irrelevant sample phone column. The learner explains minimum necessary disclosure and distinguishes viewing from editing when those options are available. Inspect actual settings only in an approved dummy-data environment. A described permission setting is reasoning evidence, not proof the learner changed one online.

DG-15

Distinct credentials reduce the effect of one account's credentials being exposed across other accounts. A second factor provides another verification step; it does not make every message or transaction trustworthy. An unexpected approval prompt should trigger a pause and independent account/support verification, not automatic approval. Accept a current official help route or supplied copy with its limits identified. Never collect real credentials or recovery information as assessment evidence.

DG-16

Look for a real second method, a credible help source or demonstration, a checked result and a reasoned comparison. Keyboard find versus a visible search control is one example. The note should explain the action and effect, not merely state “I learned a shortcut.” A failed first attempt is acceptable when followed by a clear diagnosis and corrected or appropriately unresolved result.

DG-17

The PDF must show all three rows, current totals 24/18/6, title and fictional-data note without clipped columns. The editable source remains available. The learner should explain that a PDF view preserves a presentation for the reader but does not offer the same editable formula workflow. If the first export clips a column, a revised export plus visual check is stronger evidence than assuming success because a file exists.

DG-18

A useful plan names a new purpose, actions that transfer, a genuinely new step and an access/support choice. Observe one action on dummy data. Example: create and reopen a fictional appointment table, then identify that online calendar permissions would need separate learning. The strength and next step must refer to evidence. A proposed future use is not recorded as completed workplace transfer.

Source: SkillPlan, revised March 2024, Digital pp.71–77. All answer models and numerical practice records are original classroom material.

Answer guidance • Problem solving

Observe the reasoning process as well as the result. Accept a different feasible choice when the learner explains the criteria and evidence. Do not accept an unsupported claim merely because its final recommendation matches the model. All costs, times and records are fictional.

PS-01

A bounded statement identifies ten learners needing individual 25-minute digital turns, three available devices, different departure limits and the extra budget. Example: “We need a feasible classroom arrangement so all ten learners can complete their own digital turn within their availability and the $50 extra limit after two devices become unavailable.” “The group is too large” assumes changing enrolment is the solution and omits the actual outcome and constraints.

PS-02

Required: genuine individual turn, no more than $50 extra spending, and completion within each person's availability. Preferred: everybody finishes by 10:00. Device familiarity is not stated as mandatory; access and usability must be checked rather than assumed. A respectful question is “Would this proposed time and device setup work for you, or is there an adjustment we need to arrange?” No personal explanation should be required.

PS-03

Learners need usable access and a genuine turn; the instructor organizes and observes learning; the office confirms/reserves loans and spending arrangements; the technician handles unavailable equipment. Accept coordinator responsibility where it is clearly distinguished from the learner's proposal. Learners can identify access needs, check schedules and contribute ideas without authorizing expenditure or repairing devices.

PS-04

Provided facts include three working devices, ten learners, 25-minute turns, 5-minute group changes, three departures at 10:00, remaining availability until 11:00, loan cost 40 and deadline 08:30. Possible real-delivery checks include compatibility/access settings, pickup/delivery, current reservation and who authorizes payment. A device's colour is normally irrelevant unless the learner offers a genuine identification/access reason. The checklist should not overwrite supplied facts with guesses.

PS-05

Questions should specify purpose and recipient. Examples: “To restore the five-device schedule, can the office confirm both compatible loan devices by 08:30 for the stated $40 total?” “Does the proposed first-group time work for your available time?” “What must each learner demonstrate during the five-minute save/reopen check?” If a partner cannot answer from the brief, the learner should mark it unresolved and identify a confirmation route.

PS-06

The two records conflict on availability, which changes whether a later plan includes everyone. A sound response records both statements, asks the coordinator to confirm the current availability without demanding private explanations, and temporarily preserves the brief's three early departures. Do not choose the sticky note just because it makes the preferred schedule easier. The classroom calculations continue with three early departures as instructed.

PS-07

Possible contributors include near-identical file names, an older file left open, search results that made the wrong version easy to select, and the absence of a displayed version example. Each needs its evidence and limit. The record does not establish every correction's cause. A respectful check could observe which version learners select using dummy files and ask what made the intended file clear or unclear, without collecting names unnecessarily.

PS-08

The map should distinguish observations from hypotheses. Example test: provide a clearly named current-file folder and ask learners to find the specified version; record successful selections and questions. Fewer wrong selections would support usability, but other changes and small samples limit causal conclusions. If learners still select the old version, investigate search routes, open files or instructions rather than declaring the test a personal failure.

PS-09

The colleague's statement confuses an observed improvement with proof of cause and labels prior behaviour without evidence. A supported alternative is “Fewer reviewed sets needed correction in the sessions using the revised arrangement.” A useful question is “Which part of the revised arrangement helped learners identify the current version?” The learner should identify a specific revised assumption, not simply report agreement with the partner.

PS-10

Examples of distinct routes: separate current and archived files; display a version-check example; add a pre-print check; provide an accessible written/audio instruction. Each should include a mechanism, effort and check. Three stronger verbal reminders are not meaningfully different routes. The partner contribution must be identified and considered, even if not chosen.

PS-11

Loan plan: 5 devices, 2 groups, `25+5+25=55 min`, cost $40, can finish 09:55 and meet all mandatory criteria. Extended plan: 3 devices, 4 groups, `4×25+3×5=115 min`, cost $0, can finish 10:55 if early departures receive earlier turns. Later room: cost $60 exceeds $50; 10:00 start excludes three learners. Paper-only: does not provide actual Digital evidence. Either feasible route can be justified by the priority given to time or spending. Requirements cannot be traded away with an unexplained score.

PS-12

For loans, drawbacks include extra cost, reservation deadline and reliance on availability. For extension, drawbacks include longer waiting and later finish for some learners. A suitable challenge could ask whether required access settings are confirmed or whether the longer schedule remains usable. Accept a revised choice when the learner explains the new evidence. Assess reasoned response, not winning an argument.

PS-13

A loan plan should identify confirmation before 08:30, classroom setup/check, group assignment and observed individual turns. A possible schedule is Group 1 09:00–09:25, reset 09:25–09:30, Group 2 09:30–09:55. Put the three early-departure learners in either group where available. An extended plan uses four groups and places those learners in an early group. The office/coordinator authorizes/reserves; the learner supplies a proposal. Every plan needs an evidence check and a fallback/confirmation point.

PS-14

A valid fallback is groups 3, 3, 3, 1 at 09:00–09:25, 09:30–09:55, 10:00–10:25 and 10:30–10:55. Place all three early-departure learners in the first group, or otherwise ensure completion before 10:00. Extra cost is $0 under the provided facts. Explain the later finish, waiting arrangements and need to reconfirm usable access in real delivery. Paper planning during waiting does not replace any person's 25-minute device turn.

PS-15

The immediate decision is what can appear in tomorrow's display. The approved diagram and fictional information are available; permission for a particular story/photo is absent. Feasible routes include using the approved material now and considering a later separately directed contribution, or postponing a proposed

addition until the appropriate permission and scope are established. A personal connection and an approaching deadline do not supply permission. A recommendation should retain an inviting useful display while making no claim to speak for a Nation or community.

PS-16

Possible checks: all 10 control a device; each completes the save/reopen task with support recorded; departure needs respected; actual cost≤$50. Attendance 10/10 is met, observed completed individual task 9/10 is not enough for full completion, cost $40 is within budget and availability is respected. Arrange the remaining learner's individual turn and record Digital evidence only after it occurs. Do not call the whole plan a failure without recognizing met criteria, or a complete success while ignoring the missing turn.

PS-17

Before: 9 corrections/30 sets=30%. After: 1/20=5%. Difference 25 percentage points. A supported interpretation describes a lower recorded proportion after the revised arrangement and notes that the sessions/groups were not controlled or necessarily comparable. A useful feedback question asks whether file labels and the version card were clear and accessible. A next observation might record version-selection routes in another class, alongside correction counts. Do not attribute the difference solely to the folder or generalize it to every learner.

PS-18

Look for all six steps and a labelled original practice document. A two-time notice needs confirmation of the authorized current time before travel advice is given; an unquantified supply item needs its quantity/specification before ordering. Alternatives could include holding the uncertain part while completing confirmed work, asking the responsible contact, or issuing a clearly marked correction after confirmation. The evaluation should specify how the corrected information will be checked. A personal reflection needs an example of reasoning, and proposed workplace transfer remains a plan until observed.

Source: SkillPlan, revised March 2024, Problem Solving pp.78–84. Answer models and case records are original classroom material.

Answer guidance • Communication

Observe meaning, purpose, clarification and accessibility. Accept agreed modes and record supports. Do not use eye contact, accent, stillness or response speed as universal criteria. A receiver who has read the script may show reading-supported comprehension; use a fresh comparable message if the intended evidence is receiving an unfamiliar message. Recording is optional, and no external call or message is required.

CM-01

Useful listening targets include the change, current location, start/end time, what to bring and relevant limits. The main purpose is communicating Thursday's changed classroom arrangement. Supplied details: Room 2, 10:00–10:45, workbook and pen, indoor card activity, printed maps available, usual contact for discussing an access issue. Transport and parking arrangements remain unknown. Assess correct identification without requiring a long written response.

CM-02

The pair should identify a plausible barrier and agree a practical adjustment, such as one speaker at a time, quieter position, enlarged text or response time. The check should concern actual understanding, such as paraphrasing the room/time. Do not require a diagnosis or allow the exercise to become an imitation of someone else's disability. Both people share responsibility for a usable exchange.

CM-03

For Case A, the listener identifies Room 2 as the change and checks a relevant detail. For the second message, key details are tomorrow 13:00, same classroom, revised card record and printed copies if needed. Each learner needs both a sending and receiving turn. An attentive posture without a meaningful response is insufficient evidence; an accurate response using an agreed access method is valid.

CM-04

A model paraphrase: “Thursday's indoor card activity is now in Room 2 from 10:00 to 10:45. We bring the workbook and a pen; printed process maps will be there.” The sender must confirm or correct against the actual message. Look for invitation to correct and an accurate revision if needed. Do not reward added bus, arrival-time or approval claims that were not supplied.

CM-05

A suitable response is: “The message does not say whether transportation is provided. We should ask the instructor or published course contact before making that assumption.” Practical clarification could ask which workbook version is intended; action clarification could ask how to confirm the room change with someone

who saw the earlier notice. The question should help the task and avoid demanding another person's private reason for an access need.

CM-06

The learner should identify Room 1 versus Room 2 and 11:00 versus 10:45, point to the current supplied message and invite joint verification. Example: “I have a different version here: Room 2, ending 10:45. Could we check which message is current before we pass it on?” End with the corrected agreed message or a clearly identified unresolved source question. Accusation is unnecessary and does not establish accuracy.

CM-07

Accept an accurate introductory explanation and a concrete classroom example. Aggregate: mineral materials such as sand, gravel or crushed stone. Haul: move material between places. Paver: equipment that places asphalt mixture in the paving process. Compact: make placed material denser through the appropriate technical process. The learner should invite a question and keep operating settings outside the explanation. A clear explanation should not become a false rule about every job.

CM-08

A usable three-step instruction is: 1 arrange the five stage labels in order; 2 add one purpose below each and use equipment cards to check terms; 3 each partner explains one connection and checks understanding. Observe the receiver's restatement and the sender's revision if needed. The task concerns stage labels, not forcing six equipment cards into an identical five-stage sequence.

CM-09

A clearer model: “Arrange the five stage labels in process order on the map. Use the equipment-purpose cards beside the map to check the terms. Then explain one connection to your partner and ask them to restate it.” Accept equivalents identifying objects, recipient and purpose without relying on pointing. The listener's description of their next action is the useful test.

CM-10

Room change: inform and confirm understanding. File version: request a decision/clarification before printing. Heading: propose an improvement and invite consideration. The messages should state their purposes and any response required. “We are using my new heading” is not a proposal if approval remains pending. A helpful request names the specific uncertainty rather than saying “fix the files.”

CM-11

The caller introduces the purpose, asks about indoor/location arrangements, receives the answers, checks back and identifies any unanswered point. Office role may confirm indoor activity, Room 2 and relevant times from Case A. They should not invent transport, eligibility or attendance consequences. Both roles should

distinguish known information from an issue to refer to the instructor.

CM-12

Completed: material-flow cards printed; equipment-purpose cards checked. Pending: print equipment cards; room sign still has the old location. Confirmation needed: who is authorized to replace the sign. A model handover makes these categories clear and asks the recipient to state the understood next step. Do not count an unauthorized sign change as successful communication.

CM-13

New-learner version should explain terms and broad sequence; instructor-review version should identify accuracy checks and limits. Both preserve pit/quarry → plant → haul → place → compact as the simplified introductory flow and avoid operating instructions. The learner should name audience assumptions, test them through feedback and make a useful revision. More technical words alone do not make the instructor version better.

CM-14

Observed: several-second pause and looking at the printed map. Plausible interpretations include considering the question, checking information, processing a term, using a response strategy or choosing whether to answer. A respectful response might be “Would more time or a different way of answering help?” Do not require the person to explain a cultural practice, diagnose them or conclude disinterest from one behaviour.

CM-15

Possible replacements: “Would a short example, a diagram or another format help with this explanation?” and “Is this a comfortable way to discuss the map, or should we adjust anything?” The questions concern this task and person, with room for a brief response or choice. They should not demand a community-wide explanation or treat eye contact as mandatory. The partner may use the supplied preferences instead of personal information.

CM-16

Look for an agreed mode, a way to take turns, a repetition route and correct confirmation of Room 2/10:00. Each learner sends and receives. An observer should record what enabled the exchange and whether the message was understood. Speech, sign, text, AAC or another agreed available mode can meet the interaction purpose; do not grade against one physical form.

CM-17

The receiver notices that the room is missing rather than guessing it. The sender supplies Room 2 through the agreed route, then checks the whole message: 10:00 in Room 2, ending 10:45. A working microphone or delivered text alone does not prove understanding. The completed check-back does. The omission is a safe

classroom simulation, not a real disruption imposed on a learner's access tool.

CM-18

The adapted message must preserve the three status categories from CM-12, identify the intended next action and allow a question/response. Look for a tested adjustment, such as explicit labels, named objects, clearer responsibility or accessible formatting. The final reflection should identify a new plausible context and a specific strategy, such as separating completed work from approval still needed. Record proposed future transfer separately from the demonstrated classroom exchange.

Source: SkillPlan, revised March 2024, Communication pp.85–91. Case scripts and response models are original classroom material.

Answer guidance · Collaboration

Use this guidance with Chapter 7. Judge the learner's observed actions and reasons, not confidence, accent, eye contact or willingness to disclose personal knowledge. Written responses can support the record, but a written account alone does not show that an interaction occurred. Record **Not observed / Not yet demonstrated / Demonstrated with support / Demonstrated independently** for the stated criterion; record transfer separately.

CL-01 · Find the shared goal

A suitable goal is: “The pack is ready when it gives an accurate five-stage process, explains the fictional owner and contractor roles, provides the full session schedule, and a reader can find the information.” The process is pit or quarry → plant → haul → place → compact. The owner is the fictional Town of Willow Reach; the contractor is fictional Pathway Paving Company. The brief does not authorize worksite entry, equipment operation or operating settings. Look for the learner finding the relevant brief wording rather than simply accepting the partner's answer.

CL-02 · Agree how to begin

Useful agreements include asking before replacing someone else's wording, checking a source when facts differ, allowing a thinking or supported-communication turn, and reporting an unresolved question at the check-in. An agreement such as “everyone must speak immediately” would exclude some participation routes. Evidence should show a proposal from each member, discussion and an actual agreed process. Identical tasks are not required; meaningful opportunities to contribute are.

CL-03 · Take a role, then hand it over

A model handover is: “I checked the role names against the brief. The draft still needs the fictional-example label. Please add that label, then ask the reader to locate the owner.” The receiver should restate both the completed check and pending action. Observe a role change and a contribution from each person. “My part is done” without status, uncertainty or next action is incomplete evidence. A person using a scribe or assistive communication tool can direct a valid handover; record the support.

CL-04 · Repair an excluding process

The problem is that the shared information and decision process are inaccessible to one member. Accept a printed copy with review time, a larger shared display, a spoken review controlled by the participant, or an agreed pause for a written contribution. The response should not diagnose the excluded person or assume deliberate malice. Evidence of meaningful participation could be the member checking a specific fact, suggesting a change and receiving a response before the final decision.

CL-05 · Use two perspectives

A preparer might ask whether copy-format preferences are confirmed. A visitor might ask when the session finishes or whether there is time for questions. The brief answers the end-time question: questions end at 10:45. It requires a format check but does not initially state the results. Questions about an actual address, transport route or access arrangement need coordinator clarification; learners must not invent those details. Both perspectives should influence the review, not merely appear as labels beside the same answer.

CL-06 · Invite knowledge without claiming it

A suitable response is: “It makes sense to want the material to connect with learners. We cannot assume an online image or teaching is ours to use, or that it represents the people in this room. We can make the information clear and invite different ways to contribute now. Any specific community content needs appropriate local guidance and permission.” Accept other respectful wording. Do not require learners to identify a Nation, supply a teaching or contact an Elder. The instructor and appropriate knowledge holders or authorized community representatives guide any proposed local addition.

CL-07 · Sort the disagreement

The roller sentence is a factual issue checked against the supplied process source. The layout is a design preference assessed against the brief and a reader test. The lack of an agreed correction process is a team-process issue requiring an agreement. Voting cannot establish which machine places the mixture; a majority can share the same misunderstanding. A sound answer identifies what kind of evidence resolves each issue rather than using the same decision method for everything.

CL-08 · Practise a useful disagreement

Observe both reasons being heard, a listener restatement and a next action tied to the reader's needs. A model exchange is: “You prefer the diagram because it shows the sequence. Have I understood? I prefer the question boxes because visitors can find the owner. Could we test both with the same reader questions?” The outcome may be a combined layout or a test rather than immediate agreement. Feedback should cite an exact interaction. A staged script read without listening is a rehearsal, not full independent evidence.

CL-09 · Choose the right support

A heading preference can usually be discussed through purpose and a reader check. Apparently conflicting sources call for identifying the exact discrepancy, keeping it unresolved and asking the coordinator or instructor for clarification. A personal or discriminatory remark can justify stopping and seeking instructor support; the learner need not resolve harmful conduct alone. Accept appropriate immediate support choices without requiring a particular emotional display. Do not present an invented reporting procedure as a real employer's policy.

CL-10 · Build a task board

Every required section and the final check needs a responsible person or pair, a usable handover and a checking method. For example: process card / learner pair / marked source and draft / another member verifies order and qualification. A dependency might be that the formatter needs checked wording before final layout. A sound delay plan names when and how the team will be informed and what can continue. The board should not assign all important decisions to the keyboard user by default.

CL-11 · Check before combining

Confirmed details may include the five-stage order, the owner and contractor names, 10:10–10:30 equipment activity, or 10:30–10:45 questions. A useful check states which source line was used. A correction must be acknowledged and resolved or clearly left pending. If the draft is already accurate, an explanation of the check is sufficient; learners should not manufacture a mistake. Observe the author receiving the check and confirming the action, not just a checker silently editing another person's work.

CL-12 · Facilitate one short meeting

Look for a clear purpose, invitations to each participant, an accessible contribution route, recognition of a dependency and an accurate next-action summary. The facilitator should check at least one person's understanding of the summary. Talking for most of the five minutes is not evidence of facilitation. A supported facilitator can use a checklist or prepared prompts. Record the support and the actual action rather than judging leadership style.

CL-13 · Replan together

Changes include two large-print requests, one spoken-review request, a second room available only from 10:10–10:30 and ten remaining minutes of computer access. The six-visitor count, core content and main schedule remain unchanged. A feasible plan uses the computer for the final file or print-format preparation while source checking and spoken rehearsal continue on paper. The team can request later instructor printing with clear version/copy instructions. Do not infer personal reasons for format choices or promise a separate equipment demonstration.

CL-14 · Produce and test the shared pack

The reader should find the correct process order, Town of Willow Reach and 10:45 end time. The plan must address the two larger-print requests and one spoken review within the stated classroom arrangement. The product should retain fictional labels and the additional-steps qualification. Collect reader responses and the team's reasoned revision. Assess each learner's explanation of their own contribution separately from the group's product quality.

CL-15 · Compare result and interaction

Product evidence might be an accurate schedule and a reader locating the owner. Interaction evidence might be a partner restating a handover and a member's format suggestion being considered before the decision. “Everyone was nice” is insufficient without an event or phrase. A useful improvement could be checking pending questions before formatting or giving each person a source copy at the start. Distinguish a factual misunderstanding needing instruction from a participation problem needing a process change.

CL-16 · Test one team improvement

A valid test identifies the chosen practice before the new task, observes it during the four-line summary and evaluates its effect. For example, the receiver restates each handover, revealing that a pending format question was about to be treated as confirmed. The team can keep, alter or reject the practice with reasons. Success does not require a flawless summary; learning from a visible test is the intended evidence.

CL-17 · Transfer to another setting

A supply handover may need item counts, condition and a recipient check; a room booking may need dates, permitted use and confirmation; an office update may need version control and approval. Retained practices could include inviting contributions or confirming handovers. Locally needed details include responsible contacts, actual procedures and document permissions. Treat the response as a transfer plan unless the learner later performs and documents a new task.

CL-18 · Build your collaboration evidence note

The note should connect all six components to specific actions or artifacts: role/handover, inclusion adjustment, disagreement process, facilitation, finished shared work and a tested improvement. A useful goal is “At the next check-in I will invite each person's status and ask one receiver to restate the handover.” “I will be a better team player” lacks an observable action. A partner or instructor can verify the description while recognizing that some components may still be Not observed and need another task.

Source note: Component names and the distinction between interaction quality and group-product quality follow the supplied SkillPlan guide, pp.92–96. The answer models are original teaching guidance, not official scoring standards.

Answer guidance · Adaptability

Use observable plans, actions, revisions and learner-selected strategies. Do not infer adaptability from cheerfulness, emotional disclosure, obedience or endurance of harmful conditions. The four local descriptions are **Not observed / Not yet demonstrated / Demonstrated with support / Demonstrated independently**. They are not official skill levels. An appropriate request for support or a boundary can be evidence of responsible adaptation.

AD-01 · Separate the purpose from the schedule

The folder records a checked industry table, a short project note and a reflection about an improvement. The initial deadline is Friday at 12:00. Resources include the paper brief, invented table, two classroom periods and a digital tool; the instructor is an available support. Completing a folder does not establish independent performance in every skill. Digital requires observed tool actions, including entering/checking, saving and finding/reopening; a paper table can preserve numeracy evidence but not those digital actions.

AD-02 · Write a goal you can check

A suitable goal names a product or action, a criterion and an agreed time, with support visible. Example: “By the end of Tuesday, I will have a table with the three source rows, labelled totals and one recorded check, using a calculator and instructor clarification if needed.” A valid question might concern which checking method to record. Avoid goals that promise official competence from a single exercise or rely on an unconfirmed resource. Accept learner-authored goals for the note or reflection if feasible.

AD-03 · Build a first plan

Tuesday: 20 + 25 + 15 = 60 minutes. Thursday: 35 + 25 + 15 + 15 = 90 minutes. Combined supported work is 150 minutes. Dependencies include checking numbers before communicating them and completing an attempt before reflecting on its revision. The buffer allows questions, tool delays or revision; it is not evidence of a learner deficit. The plan should show outputs and checks, not just a list of durations.

AD-04 · Compare useful responses

The second response can reveal which outcomes remain required, what time or resource has changed, what support is available and which decisions need confirmation. “I will finish somehow” hides those questions and may create an unrealistic commitment. Suitable situations include an ambiguous deadline, changed file format or reduced device access. A pause for clarification should lead to a useful question or action; the learner need not describe an emotional state.

AD-05 · Rehearse a strategy by choice

Observe the chosen strategy and its relationship to the task. For example, the learner requests the change in writing, marks the new deadline and asks what remains unchanged. A reflection might say that the written version helped identify the actual change, while a larger font would make the next review easier. A learner can decline one strategy and select another. Do not require breathing exercises, closed eyes, personal stress histories or a particular outward expression.

AD-06 · Set a boundary and a next step

A suitable response is: “I can prepare the draft now, but I cannot mark the source check complete before doing it. I can label it pending and agree a time to finish the check.” This preserves honest evidence and identifies a workable next action. Accept equivalent wording or an appropriate support request. The response need not satisfy an unreasonable request. Do not grade willingness to comply with a misleading or unsafe instruction as adaptability.

AD-07 · Choose a better second attempt

Reasonable actions include using the remembered file name in the available search or recent-files tool, checking the known save location with the instructor, or reviewing a supported saving demonstration. The learner should check that the found file contains the intended practice data, not merely a similar name. Existing evidence includes entry and a saving attempt; finding/reopening remains unobserved until performed. Repeated random folder opening without using available clues is a weaker strategy.

AD-08 · Keep, change or ask

Comparing source rows is a useful next action. Repeating the unchanged calculation without checking inputs needs revision because it may repeat the same error. Requesting an accessible copy and asking for one saving-step demonstration are appropriate support requests. Claiming a partner's file as one's own is not acceptable evidence; the learner needs an actual tool turn. The explanation should connect the choice to accurate information and genuine performance, not label the fictional learner's personality.

AD-09 · Make a retry record

The record must show a first result, a specific changed method, a second result and support used. A model is: “I could not locate the file; I used the remembered name in the recent-files list with a prompt; I found the correct table and checked one value.” An unfinished second attempt can be valid learning evidence if recorded honestly with a next step. A supplied case analysis demonstrates reasoning about a retry; it is not evidence that the learner performed the digital action.

AD-10 · Identify what changed

Changed conditions: Thursday drops from 90 to 60 minutes; device access is restricted to the final 25 minutes. Unchanged outcomes include accurate source use, an authored note, actual digital actions and a reflection. Decisions to confirm include booking Monday and any proposed alternative deadline. Time reduction: 90 – 60 = 30 minutes. Digital gap: 35 – 25 = 10 minutes. The appointment provides an opportunity to collect remaining evidence; its existence does not prove completion.

AD-11 · Revise a goal and schedule

One feasible model uses Thursday's first 35 minutes for 25 minutes of drafting and 10 minutes of source-label review. The final 25 minutes are for actual tool work, with completed and pending actions recorded. Monday's confirmed 10-minute device appointment addresses the remaining digital evidence. The separately offered five-minute paper-review period is used to update the reflection; both finish by the agreed Monday 12:00 deadline. Friday remains a partial review of the note and interim reflection. Other plans are acceptable if they fit the stated access limits and identify which changes require agreement. Do not assume a faster digital performance without evidence.

AD-12 · Communicate the revised commitment

A model update is: “Thursday is now 60 minutes, with the device available for the last 25. I plan to draft and check the note on paper first, then use the tool and record what remains. Please confirm the Monday appointment so I can finish the remaining digital evidence by Monday noon. Friday's folder will label pending work.” Observe the listener restatement and a correction if needed. The message does not need private reasons for the change.

AD-13 · Turn feedback into actions

Checklist: identify the Town as owner; identify Pathway Paving as contractor; label $120,000 as total fictional funding; replace the universal-rules claim with a current-applicability check; state finding/reopening as pending. Keep the concise format and project identification. “Try harder” does not locate an error, identify evidence or specify a revision. The learner should compare each action with the supplied facts rather than simply copying an instructor's preferred wording.

AD-14 · Revise and compare

A valid model is: “In the fictional Willow Reach project, the Town owns the road and Pathway Paving Company performs the contracted work. Total practice funding is $120,000; this is not a profit figure. Current applicable requirements need confirmation from authorized project documents. I have entered and saved the practice table, and finding and reopening it remains to be demonstrated.” Differences should include roles, money meaning and honest digital status, with the requirements correction also recognized. Reader feedback must check the actual meaning, not only grammar.

AD-15 · Prepare for another change

Bring the practice file name, known save location or approved transfer method, a record of completed actions and the remaining check. Ask the instructor where practice files are stored on the different computer and how the relevant application is accessed. The learner may use a different navigation sequence while preserving the goal of finding and reopening the intended file. Do not include real passwords, assume personal cloud access or claim that a different screen layout makes prior learning worthless.

AD-16 · Test a strategy in a new task

The evidence includes a prediction, chosen strategy, actual attempt, observed result and a decision about further use. For example, the learner predicts difficulty locating headings in a new document, uses a heading scan and then checks whether the located passage answers the question. If it does not, the learner can revise the search. Record prompts or assistance. A prediction alone is a plan, not successful transfer.

AD-17 · Build a one-week practice plan

A useful plan has two feasible opportunities, a task and resource for each, an observable check and a backup that preserves the intended outcome. A paper substitute may preserve reading or numeracy but cannot replace all digital evidence. The learner should name a decision rule, such as seeking a demonstration when the same saving step remains unclear after a supported attempt. Dates can be fictional; do not require disclosure of home, family or work commitments.

AD-18 · Review all six components

A complete review links responsibility, persistence, a selected regulation/focus strategy, goal adjustment, prioritization and self-improvement to actual activities. Accept Not observed where no appropriate evidence was collected. Do not require learners to invent support or evidence gaps: an accurate record of independent performance can lead to a new practice challenge. A useful next goal is “During the next changed brief, I will mark changed and unchanged requirements before revising the plan.” Do not award all components from a general statement such as “I stayed positive.” Proposed use outside class is a transfer plan until there is a documented new context and action.

Source note: Component names and instructional considerations follow the supplied SkillPlan guide, pp.99–105. The schedules, feedback records and answer models are original ACCESS IS4S classroom examples.

Answer guidance · Creativity and innovation

Assess the learner's questions, alternatives, development, testing, revision and support for other people's ideas. Artistic polish, fast speech and industry-wide novelty are not required. Use **Not observed / Not yet demonstrated / Demonstrated with support / Demonstrated independently** as local task descriptions, not official levels. A finished object alone does not provide evidence for all six components.

CI-01 · Notice before proposing

Known facts include the three kit contents, one complete kit of each type, four recorded waiting times, available scrap materials and the black-and-white/no-personal-data requirements. Open questions include why items become mixed, how users currently return them and which display is easiest to use. Avoid assuming carelessness or a universal reading preference. The four times show that material-finding took time in those fictional sessions; they do not isolate causes or prove a proposed solution. Optional arithmetic: 6 + 8 + 4 + 7 = 25 minutes; the mean is 25 ÷ 4 = 6.25 minutes, but no causal conclusion follows from that calculation.

CI-02 · Define the useful change

A suitable question is: “How could we help a first-time learner find and check the right practice kit using a system that works without colour?” It identifies a user, task and constraint while leaving multiple solutions open. “How could we make a red folder system?” selects a solution before examining alternatives and conflicts with reliance on colour. Accept questions focused on returning or restocking if they preserve the actual task and limits.

CI-03 · Ask from another viewpoint

A first-time learner may ask how to tell kits apart; a learner wanting larger print may ask whether labels are readable at the shelf; a room-resetter may ask how to know a kit is complete. The brief provides names, counts and constraints, but does not prove label readability or specify every return step. Those need a user check or clarification. The exercise uses fictional viewpoints; it does not authorize assumptions about a particular learner's needs or require disclosure.

CI-04 · Compare two design questions

The first question assumes people are losing cards and directs attention toward blame. The second asks how the system can make contents and gaps visible, which can be tested. A useful rewrite is: “How could the return process help people keep the kit together and notice when a piece is missing?” It still does not establish the

actual cause of missing pieces or which design will work best. Look for a question that opens investigation rather than simply replacing a negative word with a positive one.

CI-05 · Generate three different options

Accept alternatives such as labelled folders with contents lists, a matching-space board and a return tray with a rebuilding checklist. Different colours on the same folder are not three distinct organizing ideas. Each option should explain finding and checking, plus a question to test: label visibility, shelf fit, reset time or reliance on a helper. Sketches can be rough or supported by spoken explanation. The criterion is a meaningful range of possibilities, not drawing skill.

CI-06 · Help another idea develop

Observe a clarifying question, an offered extension and the author's decision. A model is: “Where would the learner see the contents list before opening the folder? Could a short list also appear on the front?” The author may use, modify or decline the suggestion with reasons. Record credit only in the agreed way. Taking over the design or insisting the author accept the suggestion does not meet the intended support behaviour.

CI-07 · Break one unnecessary assumption

The brief does not require colour coding, a full-page instruction or a polished first draft. Alternatives include codes and names, a short visible checklist or a rough paper model. Required limits remain: accurate source content, black-and-white usability, no learner personal data, shelf fit and manageable updates. A sound answer distinguishes an unnecessary habit from a genuine constraint; “innovation” does not justify discarding source facts or access requirements.

CI-08 · Compare features with reasons

Option A may be compact and easy to update, but its internal list may be missed. Option B may make gaps visible, but shelf fit and loose-card handling need testing. Option C may simplify immediate returns, but creates a helper responsibility and potential delay. These are predictions until tested. A justified criterion might be fitting the shelf or quick resetting. Any selected first prototype is acceptable with a reason tied to the brief and an honest account of remaining questions.

CI-09 · Specify the prototype

Correct initial contents are P: five stage cards + six equipment-purpose cards + one instruction card = 12; N: one data table + one worked example + two blank record sheets = 4; C: four message cards + two role cards + one checklist = 7. The specification should show first action, contents check, missing-item response and updating method. A model missing-item instruction is to leave a status slip with the kit and tell the instructor. It must not display or blame the last user's identity.

CI-10 · Make a small usable version

The prototype must represent at least one complete kit, with accurate labels and a usable missing-item step. Accept paper, movable dummy cards, an accessible digital mock-up or another format that can be tested. Distinguish finished prototype features from future suggestions. A beautiful heading without contents or a checking sequence is not yet usable. Do not require purchases, permanent room changes or cultural imagery.

CI-11 · Plan a fair small test

A suitable test asks a willing partner to find N, check its contents and respond to a missing worked example. Record actions such as which folder was opened, whether the count was checked and where the status slip was placed. A design-focused question is, “What information were you looking for at that point?” Record any help. One successful test applies to that person, task and conditions; it does not establish universal usability or a measured improvement in all classrooms.

CI-12 · Give and receive useful feedback

A useful observation is “I found the folder name but did not notice the contents list until I opened it.” A question could ask whether the list could be seen before opening. A suggestion should connect to that observation and the brief. Observe the author restating the feedback and making a reasoned decision. A supported walkthrough is legitimate practice but must be labelled as supported. Compliments alone or a judgement about the author's ability do not provide the intended revision information.

CI-13 · Separate findings from guesses

Observed: the first user found N and counted four items; when one item was removed, they noticed three but did not know where the slip belonged. Possible explanation: the relevant instruction was hidden on the reverse. Next check: make it visible and test placement again. The used-sheet question reveals an unstated rule, so the instructor must clarify it. The new five-item requirement requires version/content updating. Retain the useful large name/code and clear inventory rather than discarding the entire design.

CI-14 · Revise for the changed kit

Version 2 contains one data table, two worked examples and two blank sheets, total five items. The used sheets stay with learners' practice work; the kit is restocked with two blank sheets before reuse. The revision should make the current version clear, remove or clearly supersede the old four-item list, and show the missing-item response where it can be found. Each change should trace to the test or updated brief. Extra decoration without a user purpose does not count as an evidence-based improvement.

CI-15 · Retest and make a limited claim

Record whether the user found N, identified five required items and explained both missing-item and used-sheet steps. Include task conditions and support. A valid conclusion is: “In this classroom test, one user followed the revised list and return steps without prompts; the design still needs checking with another user and the other kits.” If prompts were needed, name them and plan another revision. Do not turn a small test into a claim that confusion has been eliminated.

CI-16 · Facilitate a short idea session

Observe a clear purpose and limits, accessible contribution choices, a generation stage before evaluation, permission for recording and a request for feedback about the process. The facilitator need not dominate the conversation or produce the final idea. Useful improvement evidence might be adding individual thinking time before discussion or making criteria visible before selection. Cultural disclosure, personal storytelling or a particular style of interaction must not be required.

CI-17 · Transfer the process with boundaries

Accept a room-booking form, a clearer practice schedule, a supply label or another low-risk information task. The response should identify a user, useful gap, at least two options and a small test. Real changes require the appropriate organizer, employer, document owner or community direction. Personal information, artwork, teachings and other people's work should not be copied merely because they are available. Equipment-operation changes are outside this classroom design task.

CI-18 · Assemble your idea-development record

The record should link curiosity to questions, opportunity identification to the design brief, idea generation to alternatives, development to the specification/prototype, application to testing/revision, and a supportive environment to observed feedback or facilitation. Name another contribution accurately and with agreed attribution. A next goal might be “In the next prototype test, I will record observations separately from explanations before choosing a revision.” Accept unobserved components honestly and identify a suitable follow-up task.

Source note: Component names and teaching/assessment considerations follow the supplied SkillPlan guide, pp.106–113. The kit system, counts, test records and answer models are original ACCESS IS4S learning material, not validated assessment instruments.

Integrated projects — answers and evidence guidance

Use this guide with the two learner projects. The calculations below follow the supplied fictional conditions. Open-ended responses are models, not wording that learners must copy. Accept another response when it meets the conditions and explains the evidence. Keep Reading, Writing, Numeracy, Digital and interaction evidence distinguishable.

For each criterion, record **Not observed**, **Not yet demonstrated**, **Demonstrated with support**, or **Demonstrated independently**, with task conditions and supports. A correctly described digital process is not the same as observed tool use. A scripted conversation is not the same as an exchange. These activities do not establish official proficiency levels, a professional qualification or automatic transfer.

CP-01 — Current instruction and initial capacity

The current event is **14 May 2027, 9:00–10:30 a.m., Learning Centre Room A**. Document A identifies itself as version 2, issued 5 May, and expressly replaces version 1. The earlier message gave 8:30–10:00 in Room B. Both the time and room changed; the date in the current notice is the date to report.

There are **18 + 2 = 20 people**. Room A's maximum is 24, so **24 − 20 = 4 places** remain within capacity. Room B's maximum is 18, so it would be **two places too small** for the same group. The learner must include the staff rather than comparing only 18 learners with 18 places.

The session lasts **90 minutes**. Its parts last 10, 20, 40, 15 and 5 minutes, adding to 90. Participants need no device and the centre supplies practice materials. Attendance does not reserve a course place. Suitable questions for the Learning Desk include how to apply or what support arrangements are available. The case does not supply an application deadline, fee or guaranteed support service; do not invent one.

Look for use of version information and explicit source evidence. An accurate answer based only on a partner's explanation does not by itself establish the learner's Reading evidence.

CP-02 — Initial budget and digital work

Item	Quantity	Price each	Line cost
Notebook	18	$2.50	$45.00
Pen	20	$0.80	$16.00
Handout	20	$0.15	$3.00
Water	20	$1.00	$20.00
Snack option 1	18	$3.00	$54.00

Item	Quantity	Price each	Line cost
Total			**$138.00**
Remaining from $160.00			**$22.00**

A reasonable estimate is around $140: notebooks and snacks together are about $100 and the other supplies about $40. One exact check groups notebooks and snacks as **$45 + $54 = $99**, with other costs **$16 + $3 + $20 = $39**, giving **$99 + $39 = $138**. Other valid checks are acceptable.

In a spreadsheet with the stated headings in columns A–D and items in rows 2–6, `=B2*C2` can calculate the first line and `=SUM(D2:D6)` the total. These are example formulas, not mandatory software syntax. A learner who enters calculated values must show the separate calculations and check the entries. Observe their own entry, checking, saving as `CP01-budget-v1` and reopening. If another person controlled the file, record the missing individual evidence.

CP-03 — Briefing, clarification and shared priorities

A model briefing is: “The current information morning is on 14 May, from 9:00 to 10:30 in Room A. The 8:30 message was the earlier version. You do not need a device. Attending gives you information; it does not reserve a course place. The Learning Desk can explain how to apply.”

A useful exchange could be:

- Participant: “So I should come to Room A for 9:00, even though my first message said 8:30?”
- Organizer: “Yes. Version 2 changed both the time and the room.”
- Participant: “And I can ask the Learning Desk about applying, but I do not have a place simply by attending?”
- Organizer: “That is right.”

A defensible shared priority is to place **date, current time and room** at the top, because the earlier information could send someone to the wrong place at the wrong time. Another choice can work if explained and the essential details remain clear. A concrete contribution note might read: “I noticed that both the room and time changed; my partner suggested putting the correction before the rest of the message. We agreed to lead with those details.”

Observe both rounds. Check accuracy, clarification, response and shared decision-making, rather than accent, eye contact, speed or the quantity of speech.

CP-04 — Initial participant message

Model subject: Corrected time and room —14 May information morning

> Please use the updated arrangements for the Learning Centre information morning on 14 May 2027. The session is 9:00–10:30 a.m. in Room A. This replaces the earlier 8:30 start and Room B message. You do not need to bring a device; the centre supplies the practice materials. The morning includes course information, a practice task and time for questions. Attending does not reserve a course place. Ask the Learning Desk about the application process, or speak with the desk privately about access and support arrangements. Please use this current notice when planning your visit.

The model is within the suggested 80–120 words after normal spacing. Accept plain wording that communicates the same facts. A useful edit might replace “come at the usual time” with the exact 9:00 start. The reader test should produce Room A and 9:00, with the Learning Desk as the clarification contact. Retain an actual revision or a justified record that the first draft already met the criteria; do not fabricate partner feedback.

CP-05 — Revised quantities, option and schedule

The learner count changes from 18 to 22; total people change from 20 to **24**. The start moves to 10:00 and the end to 11:30. Date, room, activity lengths, budget, quantity rules, contact and device arrangements remain unchanged. Room A fits **exactly 24 people**, leaving no spare places within the stated maximum.

Item	Revised quantity	Cost with snack option 1	Cost with snack option 2
Notebook	22	$55.00	$55.00
Pen	24	$19.20	$19.20
Handout	24	$3.60	$3.60
Water	24	$24.00	$24.00
Snack	22	$66.00	$55.00
Total		**$167.80**	**$156.80**
Budget result		**$7.80 over**	**$3.20 remaining**

Choose option 2. It meets the stated requirements and keeps all required supplies within $160. Option 1 does not fit. Omitting required items or adding assumed funds does not satisfy the case. A useful check is that the snack change saves **22 × $0.50 = $11.00**, and **$167.80 – $11.00 = $156.80**.

Part	Revised time
Welcome and check-in	10:00–10:10
Course information	10:10–10:30
Practice task	10:30–11:10
Questions and review	11:10–11:25

Part	Revised time
Pack up	11:25–11:30

Observe the revised file and its saved version. Adaptability evidence is the identified change, adjusted plan and strategy used. A learner might note: “I separated learner quantities from all-person quantities before updating the table.” No inference about personality or emotional state is needed.

CP-06 — Final participant sheet and design trial

Two distinct designs might be **a correction-first checklist** and **a short schedule followed by questions and answers**. A useful selection reason is: “I chose the checklist because a reader with the old notice can find the changed time immediately.” Artistic polish is not a criterion.

Model heading: Updated information morning —14 May 2027

> **New time: 10:00–11:30 a.m.** This replaces both earlier start times. Come to **Learning Centre, Room A**. The morning includes course information, a practice task and questions. You do not need to bring a device; practice materials are provided. Attending does not reserve a course place. Ask the Learning Desk about applying or about any clarification you need. You may discuss access or support arrangements privately with the desk. Please use this updated sheet when planning your visit.

The model is under 100 words excluding its heading and works without colour. It does not need to disclose the internal budget or attendance count. A valid reader test should identify 14 May, 10:00, Room A, no device required, no automatic course reservation and the Learning Desk. A useful improvement might make the new time more prominent or remove an ambiguous reference to “tomorrow.” Record the feedback actually received.

The reflection should point to an action, such as checking the snack-price difference or revising a misleading heading. A plan to use that action elsewhere is a transfer intention, not observed transfer.

CP-07 — Initial resources, people and timing

There are **12 + 2 = 14 people**, leaving **16 − 14 = 2 places** within room capacity. Six pairs need six tablets, six calculators, 12 folders and six chargers under the initial all-pairs-at-once tablet plan.

Resource	Available	Initially needed	Spare
Tablets	8 − 2 = 6	6	0
Calculators	12 − 1 = 11	6	5
Folders	18 − 2 = 16	12	4
Chargers	15 − 2 = 13	6	7

All initial needs fit. The session lasts **90 minutes**, with two **25-minute station blocks**. Each block includes a 20-minute activity and five minutes for checking, saving and moving. Each learner controls a tablet for **ten minutes** within their pair's 20-minute activity.

Conditions to preserve include completing both activities for every pair, individual ten-minute turns, finishing by 2:30, staying within room capacity and budget, and not requiring personal devices or extra helpers. Owned equipment includes unavailable items; only the available count can be assigned. If working status is unconfirmed, ask the Session Coordinator rather than silently counting it as usable.

CP-08 — Initial printing, labels and digital tables

The resource table uses the available, needed and spare entries in CP-07. Keep different resource types in separate rows.

Cost item	Calculation	Result
Practice pages	12 learners × 6 pages	72 pages
Printing	72 × $0.12	$8.64
Labels	12 learners + 2 helpers	14 labels
Label cost	14 × $0.10	$1.40
Total	$8.64 + $1.40	**$10.04**
Remaining	$15.00 – $10.04	**$4.96**

An estimate of about $10 is reasonable. An exact printing check is **70 × $0.12 + 2 × $0.12 = $8.40 + $0.24 = $8.64**. Helpers need labels under the case rule, but only learners receive practice-page sets. Observe entry, calculation or checking, saving as `CP02-plan-v1`, and reopening. A correction could be changing an incorrect folder need from 14 people to 12 learners; record an actual correction or verification rather than requiring a manufactured error.

CP-09 — Initial rotation, access and collaboration

A model helper explanation is: "There are six pairs. Initially, all pairs do the tablet activity from 1:10 to 1:35 and printed work from 1:35 to 2:00. The first 20 minutes are the activity; the last five are for checking and moving. Each partner controls the tablet for ten minutes. You do not need a personal account. We can use a printed reminder showing the two blocks."

A useful clarification is: "Does 25 minutes mean I get 12½ minutes on the device?" The response should distinguish **20 minutes of activity** from the **five-minute transition**, with **ten minutes per learner**. Another valid clarification concerns where to find the reminder or whom to ask if the plan is unclear.

A workable shared plan uses a visible time note: first partner 1:10–1:20, second 1:20–1:30, then checking/saving/moving 1:30–1:35. A contribution record can identify who suggested the printed reminder and who checked the ten-minute division. Observe actual exchange, both perspectives and a shared decision.

Do not require a learner to justify a support request through personal disclosure.

CP-10 — Initial helper handover

Model heading: Helper handover —21 May 2027, initial plan

> The session runs 1:00–2:30 p.m. for 12 learners and two helpers. Fourteen people fit the room maximum of 16. There are six pairs, A–F. Prepare six tablets, six calculators, 12 folders and six chargers. All pairs can use tablets in block 1, 1:10–1:35, and printed activities in block 2, 1:35–2:00. Each activity lasts 20 minutes; each learner controls the tablet for ten minutes. Keep the final five minutes of each block for checking, saving and moving. Use a printed station reminder and confirm the partner change. Refer unresolved questions to the Session Coordinator at the front desk.

The model fits the suggested 80–120 words with normal spacing. Accept another clear handover with the same requirements. A reader should distinguish the 25-minute block from the 20-minute activity. A useful edit might add “each learner” to a vague statement that “the pair gets ten minutes.” The initial handover should remain labelled so the later revision does not create contradictory current instructions.

CP-11 — Changed attendance, budget and feasible rotation

There are now **14 + 2 = 16 people**, exactly the room maximum. Seven pairs need seven calculators and 14 folders. Only four tablets are available after the new failures. Printing and labels change as follows:

Cost item	Calculation	Result
Practice pages	14 × 6	84 pages
Printing	84 × $0.12	$10.08
Labels	14 + 2	16 labels
Label cost	16 × $0.10	$1.60
Total without rental	$10.08 + $1.60	**$11.68**
Remaining	$15.00 − $11.68	**$3.32**

All seven pairs using tablets simultaneously would require **7 − 4 = 3 rental tablets**. Rental would cost **3 × $6.00 = $18.00**. The full total would be **$11.68 + $18.00 = $29.68**, or **$14.68 over budget**. This option is not feasible.

A rotation is feasible without rental:

Block	Tablets	Printed activity
1:10–1:35	Pairs A, B, C, D	Pairs E, F, G
1:35–2:00	Pairs E, F, G	Pairs A, B, C, D

At most four tablets are in use at once. Every pair gets one block at each station. In block 1, device turns can run 1:10–1:20 and 1:20–1:30; in block 2, 1:35–1:45 and 1:45–1:55. The final five minutes of each block remain available for checking, saving and moving. Other pair assignments work if they keep a maximum of four simultaneous tablet pairs and meet all requirements.

The rotation needs **seven calculators** from 11 available, **14 folders** from 16 available, and **four chargers** from 13 available for the four working tablets. Spares are four calculators, two folders and nine chargers. The supplied resources fit. Date, session duration, activity lengths, individual turns, budget and room maximum remain unchanged.

Check the revised saved file and the learner's explanation of a revision strategy. Merely changing the printed attendance number without adjusting pages, labels, pair assignments and tablet demand is incomplete adaptation.

CP-12 — Station guide, testing and portfolio

Two viable design ideas are **a table organized by time** and **two short routes labelled A–D and E–G**. A reason for choosing the route design could be: "Each pair finds its group once and follows two steps." Either design can work in black and white without relying on colour to identify groups.

Model heading: 21 May — where your pair goes

> **Pairs A–D:** Tablets 1:10–1:35; printed activity 1:35–2:00.
> **Pairs E–G:** Printed activity 1:10–1:35; tablets 1:35–2:00.
> At the tablet station, each learner controls the device for ten minutes. Keep the last five minutes of each block for checking, saving and moving. Change stations at 1:35. Use the printed reminder if you need to check your route. Break is 2:00–2:10, followed by shared review until 2:25. Return resources and finish by 2:30. Ask the Session Coordinator at the front desk if you need clarification.

This is under 120 words excluding the heading. Pair C should identify tablets first, printed work second; Pair F should identify the reverse. Both move at 1:35 and finish the session by 2:30. Each learner's ten-minute turn remains explicit. A useful test observation might show that "switch" needed the exact 1:35 time; the revision should address the observed issue.

The portfolio note should refer to actual evidence for all nine skills: interpreting requirements, authored handover, calculations, individual file work, option comparison, check-back, shared access plan, revised conditions, and tested design. The learner may use the project's evidence table as an index. A concrete transfer plan is: "On a different room-booking task, I will count staff as well as participants and compare the total with the stated capacity." Transfer remains a separate future observation until that task is attempted.

Instructor closing check

Confirm all 12 task records are present or identify the missing opportunities. Assess the intended action rather than appearance: a simple usable guide can meet the writing and design criteria; a polished guide can still contain the wrong time. Keep digital observation individual and retain the two versioned plans. Use learner feedback to select the next practice task rather than assigning an overall national level from either capstone.

Online research and source boundaries

Research snapshot: **23 October 2026**. This note explains the sources used alongside the user-supplied SkillPlan guide to develop the original ACCESS IS4S learner textbook and practitioner guide. The portable source ledger records titles, publishers, exact URLs, retrieval dates, supported claims, limitations and source hashes. It includes 15 online source records: four federal pages and 11 BC institutional resources, of which two Douglas PDFs received selective inspection only. Retrieval does not mean every linked publication or course was read.

The research supports practical teaching decisions: recognize adults' existing knowledge, make the skill and evidence clear, preserve learner choice, respect distinct Indigenous identities and establish local relationships before incorporating cultural contributions. It does not establish community approval, institutional endorsement or validated proficiency scores for the new activities.

A short source note for the books

This edition is informed by SkillPlan's *Skills for Success Get Started Guide for Practitioners*, revised March 2024, and current official online sources checked on 23 October 2026. Federal pages confirm the nine-skill framework and provide current component and proficiency information. Verified Douglas College, BCIT and JIBC resources inform learner agency, practitioner development and respectful local engagement. The explanations, practice cases, answer guidance and teaching tools are independently authored. Linked resources retain their own rights and conditions. Bibliographic references and blocked pages are identified as leads, not publications we claim to have read.

Current federal sources

Verified source	What was established	How it informs this edition
Skills for Success — Employment and Social Development Canada	The official introduction describes foundational and transferable skills and names all nine skills in its transcript.	Confirms the current federal resource pathway and nine-skill overview. It does not assess a learner or endorse this curriculum.
Skill components and proficiency levels — ESDC	The page provides definitions, components and proficiency descriptions, says organizations can adapt resources, and describes further refinement over time.	Supplies a current comparison point. The books attribute historical component labels to the supplied March 2024 guide rather than silently treating every label as identical to current wording.
Research Reports — ESDC	The directory lists a 2024 SRDC proficiency-development report, a 2023 implementation-guidance item, a 2022 Indigenous-skills item attributed to Northern Policy Analytics, and the 2021 SRDC launch report.	Provides research leads. Directory descriptions are verified; the underlying reports were not independently read for this research.

Verified source	What was established	How it informs this edition
Assessment and training tools — ESDC	The directory lists Douglas's Indigenous Skills for Success Journey course and learning tools. It expressly disclaims endorsement or guarantees for external websites.	Led to direct retrieval of Douglas's resources. Directory inclusion does not establish endorsement, suitability, current fees or adaptation permission.

Proficiency caveat: SkillPlan's supplied March 2024 guide calls its levels preliminary on p.19. The live federal component page was read and still describes refinement over time. The federal research directory also lists **Skills for Success Proficiency Levels Development (2024)**, but its full report and descriptor tables were not retrieved or read. This edition therefore does not claim to summarize that report's findings, establish the final status of every descriptor, or validate the classroom activities as proficiency assessments. The four feedback statuses used in the books are local teaching records, not official levels.

The research directory's label for its 2023 implementation-guidance item and its destination path should be checked before relying on it: the retrieved path names a launch report. SkillPlan's bibliography separately lists implementation guidance as 2022. Do not combine those entries into a claimed verified publication date without reading the actual report.

BC Indigenous adult-learning context

Douglas College's Indigenous Skills for Success Journey, Planting the Seeds for Growth is a directly relevant train-the-trainer resource. The landing page links the course, nine learning tools, a facilitator guide, workbook and course materials. The Facilitation Guide, printed pp.7–10 / PDF pp.8–11, discusses practitioner audiences, participants' contexts and values, individual journeys and flexible delivery. Its printed p.4 / PDF p.5 credits Carlene Quock of ACCESS on the advisory committee; printed p.6 / PDF p.7 dedicates the project to former ACCESS CEO John Webster. These are documented acknowledgements in that project, not endorsement of this edition. Selected front matter and delivery guidance were read; the whole course and videos were not reviewed.

Douglas's Indigenous Student Services describes self-directed independent learners, varied adult student circumstances, individualized supports and voluntary confidential self-identification. These institutional practices informed our emphasis on learner agency and private support conversations. They do not create ACCESS eligibility rules or promises of particular services.

BCIT's Indigenous Guides verifies the provenance of the BCcampus Pulling Together series. It identifies a steering committee including Indigenous post-secondary leaders, FNESC, IAHLA and Métis Nation BC, and Indigenous and ally writers. The linked books were inaccessible here, so their content and licences remain unverified. BCIT's Indigenous Modules page also identifies a professional-learning pathway; the course itself was not reviewed.

BCIT's Protocol Welcome and Land Acknowledgement distinguish the practices and emphasize local context and differing protocols. These sources support confirming appropriate relationships and local authority. A campus territory statement, booking procedure, honorarium amount or ceremony should not be copied as a universal ACCESS practice.

JIBC's Indigenization page connects curriculum with policies, services, relationships and community engagement. Its *Living Indigenization: Engagement Protocols & Guidelines*, ©2025, credits Heather Saranczak and Jason La Rochelle for content. Printed pp.12–17 / PDF pp.7–9 discuss dignity, self-determination, unique community protocols, distinct First Nations, Inuit and Métis identities, migration, urbanization and reciprocal relationships. The books use concise attributed paraphrases. No claim is made that JIBC speaks for every Nation or has reviewed our material.

These findings support ordinary training, work and community practice cases with meaningful choice. They do not justify invented pan-Indigenous stories, compulsory cultural disclosure or a generic ceremony. Any local cultural contribution needs agreement about purpose, authority, attribution, review, distribution and compensation. No such consultation or cultural review was completed by this research task.

Search attempts and access limits

Official sources were read directly and through institutional navigation. Actual search queries were also submitted. The full query URLs, timestamps and outcomes are retained in sources.json.

Search route and query	Actual outcome
JIBC advanced search: First Peoples Principles	Returned actual broad search results, including institutional Indigenous pages. The returned results did not verify the First Peoples Principles of Learning text. Relevant institutional pages were then read directly.
BCIT search: Indigenous education	HTTP 200 returned a JavaScript/robot challenge rather than results. No challenge was bypassed.
BCIT site search: First Peoples Principles of Learning	HTTP 503; no result content retrieved.
BCIT LibGuides search: First Peoples Principles of Learning	Returned a loading shell, not accessible result content.
Douglas search: First Peoples Principles	Query appeared in the page, but client-rendered result content was unavailable.
Douglas search: Indigenous Adult Higher Learning	Same client-rendered limitation; no search snippets verified.
Google, Bing and DuckDuckGo queries	Proxy CONNECT 403 blocked retrieval. These were attempted searches, not successful general-search coverage.

The ledger also retains two initial institutional query URLs that did not perform the intended targeted search; corrected form URLs were used afterwards. An HTTP success status alone was never treated as proof of useful source content.

Original FNESC/First Peoples Principles of Learning, IAHLA, ACCESS, BCcampus and OpenTextBC pages were blocked. Consequently, the books do not reproduce unverified FPPL text, claim a completed FPPL alignment, infer IAHLA teaching positions from its name, or describe current ACCESS services based on an inaccessible

website. BCIT's verified series provenance is a separate, narrower finding. This is a curated research snapshot with explicit access gaps, not an exhaustive literature review.

Rights, attribution and design provenance

- The supplied SkillPlan guide is attributed to SkillPlan; Canada is the identified funder, not the author. Its coverage crosswalk distinguishes source content from the original teaching materials and bibliography-only leads.
- Douglas's Facilitation Guide printed p.1 / PDF p.2 specifies **CC BY-NC-ND 4.0**. Its discussion of flexible delivery does not remove the express no-derivatives condition. This edition links to it and summarizes selected guidance; it does not remix its worksheets, artwork, stories or videos.
- JIBC's engagement guide printed p.3 / PDF p.2 states **all rights reserved**, personal-use copying only, and permission for further reproduction. Its PDF and artwork are not included in the distributed research materials.
- This directory contains source metadata and concise research prose, not full scraped pages or downloaded third-party research PDFs. Local source paths are relative so the records remain portable.
- The user-requested visual direction comes from the Numeracy Hub at commit `7c0ceaab485e36aa45c596ac58e43bba63e4f824`. Its observed CSS uses cream **#F7F4F1**, ink **#1A1512**, red **#D2181F** and gold **#FFBC00**, with Archivo, IBM Plex Sans and IBM Plex Mono font tokens. The asset notes match those values. Repository brand notes identify the typography as a recommended pairing rather than confirmed organization-wide policy. The design source does not authorize copying other institutions' Indigenous artwork.

Coverage of the full 148-page supplied SkillPlan guide

This crosswalk accounts for the entire user-supplied **Skills for Success Get Started Guide for Practitioners**, revised March 2024. It distinguishes material rewritten as original ACCESS IS4S teaching content from historical material and external references retained as an index. It does not claim that every outside publication cited by SkillPlan was retrieved, verified or adopted.

The source is the supplied PDF. Its SHA-256 is `32dad4699b1ef1ab281ad4bdf95bef310048741703fc401094c57f6c62e33caf`. PDF pages and printed folios correspond where a folio is shown; the cover, contents and section-three divider have no extracted printed folio. All references below use PDF page numbers.

The machine-readable inventory includes all 148 page records, complete extracted source text, exact six-component labels, source strategy titles, activity summaries, appendix sequences, handouts, six professional-development listings, 122 parsed bibliography entries and 194 unique external URI annotations. Its relative paths resolve from this research directory.

Coverage totals: 148 of 148 pages; 31 nonoverlapping page subsections; six overarching approaches; nine skills; 54 components; 27 instructional strategy groups; 27 grab-and-go patterns; three appendix lessons; six source handouts; six historical professional-development listings. The new learner activities provide 18 numbered opportunities per skill (162 total), with answer guidance. These counts describe content coverage, not proof of learner competence or program effectiveness.

Page-by-page section coverage

Source pages	Source section or page purpose	ACCESS destination	Treatment
1	Cover and revision date	Purpose and framework	Source identity and revision status retained; original ACCESS book identity is distinct.
2	Table of Contents	Purpose and framework; this crosswalk	Source navigation reorganized into learner and practitioner books; all page intervals are indexed below.
3–8	Welcome to the Get Started Guide!	Purpose and framework; Learner orientation; Practitioner development	Purpose, intended practitioner use, learning priorities and reflective growth planning reworked into original prose.
9	Section 1 introduction	Purpose and framework	Section navigation integrated into the new book structure.
10–11	Overview of Skills for Success	Purpose and framework; Learner orientation	Nine-skill overview, connected use and practical learner purpose reworked.

Source pages	Source section or page purpose	ACCESS destination	Treatment
12–16	Essential Skills Background	Purpose and framework	Historical framework and transition explained; old statistics/economic projections remain historical source material, not current ACCESS claims.
17–19	Shifting to Skills for Success	Purpose and framework	Modern nine skills and embedded Document Use/continuous learning explained without a forced one-for-one mapping.
20–22	Key Resources	Purpose and framework; Practitioner development; source bibliography index	Practitioner standards, growth-planning and research pathways explained; cited external works are indexed rather than claimed read.
23	Section 2 introduction	Teaching approaches	Section navigation integrated.
24–25	Approach #1: Learner-Centred	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
26–31	Approach #2: Contextualized	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
32–34	Approach #3: Complexity	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
35–36	Approach #4: Direct Instruction	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
37–39	Approach #5: Assessment	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
40–43	Approach #6: Social-Emotional Skills	Teaching approaches	Original ACCESS teaching prose, models, supports, task examples and evidence routines; source resource leads retained in the bibliography/inventory.
44	Section 3 introduction	Purpose and framework; nine practitioner skill chapters	Section navigation integrated; skill-specific coverage is enumerated below.
45–53	Reading	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
54–61	Writing	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.

Source pages	Source section or page purpose	ACCESS destination	Treatment
62–70	Numeracy	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
71–77	Digital	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
78–84	Problem Solving	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
85–91	Communication	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
92–98	Collaboration	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
99–105	Adaptability	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
106–113	Creativity & Innovation	Learner; Practitioner; answers	All six components, three strategy groups, assessment/complexity discussion, resource leads and three activity patterns reworked; details below.
114	Section 4 introduction	Integrated lesson plans; Practitioner development	Appendix purposes reorganized into complete lessons, handouts, development guidance and source index.
115–121	Lesson Plan #1: Reading an Imperial Measuring Tape (Numeracy Focus)	Integrated lesson plans	Lesson 1 and M1/M2: original safe object measurement, fraction instruction, fixed practice, answer guidance and observation; original 90-minute source allocation identified.
122–127	Lesson Plan #2: Root Cause Analysis (Problem Solving Focus)	Integrated lesson plans	Lesson 2 and P1–P5: original evidence pack, cause map, why chain, trial and evaluation; hypotheses distinguished from proof.
128–135	Lesson Plan #3: Effective Workplace Emails (Writing Focus)	Integrated lesson plans	Lesson 3 and E1–E3: original teaching passage, message model, six prompts, planning/check sheets and answers; local draft replaces required real sending.
136–138	Professional Development Opportunities	Practitioner development; directory below	Six historical listings retained as leads; current source checks are separately attributed in practitioner development.
139–148	Bibliography	complete source bibliography index	All 122 parsed source entries are indexed with original page and cross-reference metadata. This is reference preservation, not independent verification of 122 works.

The page intervals above cover 1–148 without gaps or overlap. Divider and navigation pages are accounted for as structure, rather than treated as new learning content. Each page is independently indexed in the JSON for finer inspection.

Fifty-four skill components and actual learner evidence

Labels below are the SkillPlan 2024 source labels. Current federal wording can differ slightly; the books attribute the historical labels and keep current source checks separate. Activities offer opportunities to gather evidence: completion of a chapter alone does not establish that every component was demonstrated.

Reading

Source component page 45. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Identify the task that requires you to read	RD-01, RD-02, RD-17
2	Identify the information contained in the document(s)	RD-03–RD-05
3	Make connections between different parts of the document(s)	RD-06–RD-09, RD-12
4	Understand and apply the information	RD-07, RD-14, RD-16
5	Evaluate the document(s)	RD-10–RD-12, RD-15
6	Reflect on the document(s)	RD-13, RD-18
### Writing		

Source component page 54. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Identify the task that requires you to write	WR-01, WR-06, WR-12
2	Plan the writing task	WR-02, WR-03, WR-07
3	Use written words and phrases so you can achieve the purpose of the writing task	WR-04, WR-05, WR-08, WR-09
4	Choose the appropriate language and style for the writing task	WR-06, WR-12, WR-13
5	Choose the appropriate format for the writing task	WR-07, WR-10, WR-11
6	Review and revise your writing	WR-14, WR-15, WR-17, WR-18
### Numeracy		

Source component page 62. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Identify the task that requires you to use numeracy	NU-01, NU-07, NU-12
2	Identify the mathematical information	NU-02, NU-07, NU-11
3	Make connections between related pieces of mathematical information	NU-02, NU-04, NU-13
4	Apply mathematical operations and tools you will need to answer the question	NU-03–NU-06, NU-08, NU-09, NU-12–NU-16
5	Interpret and evaluate the information	NU-04, NU-13, NU-15, NU-17
6	Share the mathematical information, results and implications	NU-06, NU-10, NU-15, NU-18
### Digital		

Source component page 71. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Use digital devices including computers, tablets, smart phones and other handheld devices	DG-01–DG-03
2	Use common digital tools to complete tasks	DG-04–DG-06
3	Use digital information	DG-07–DG-09
4	Use online tools and platforms	DG-10–DG-12
5	Apply safe and responsible practices online	DG-13–DG-15
6	Update and upgrade digital skills	DG-16–DG-18
### Problem Solving		

Source component page 78. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Identify the issue to be addressed	PS-01–PS-03
2	Gather information to help you address the issue	PS-04–PS-06
3	Analyze the issue	PS-07–PS-09
4	Develop multiple routes of action	PS-10–PS-12

Component	Exact source label	ACCESS evidence opportunities
5	Address the issue	PS-13–PS-15
6	Evaluate the effectiveness of the solution or decision	PS-16–PS-18
### Communication		

Source component page 85. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Listen with intention	CM-01–CM-03
2	Listen to understand	CM-04–CM-06
3	Speak with clarity	CM-07–CM-09
4	Speak with purpose	CM-10–CM-12
5	Adapt to your audience and contexts	CM-13–CM-15
6	Adapt to other people's different communication modes and tools	CM-16–CM-18
### Collaboration		

Source component page 92. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Work well with other people	CL-01–CL-03, CL-10
2	Value diversity and inclusivity of others	CL-04–CL-06
3	Manage difficult interactions with other people	CL-07–CL-09
4	Facilitate an environment where you can collaborate with others	CL-04, CL-12, CL-16
5	Achieve a common goal with others	CL-10–CL-15
6	Reflect and improve on how well the team works together	CL-15–CL-18
### Adaptability		

Source component page 99. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Demonstrate responsibility	AD-01–AD-03
2	Persist and persevere	AD-07–AD-09
3	Regulate your emotions when appropriate	AD-04–AD-06

Component	Exact source label	ACCESS evidence opportunities
4	Set or adjust your goals and expectations	AD-02, AD-10–AD-12
5	Plan and prioritize	AD-03, AD-10–AD-15
6	Seek self-improvement	AD-13–AD-18
### Creativity & Innovation		

Source component page 106. Learner chapter · Practitioner teaching chapter · Answer guidance.

Component	Exact source label	ACCESS evidence opportunities
1	Use your imagination and curiosity	CI-01–CI-03
2	Identify opportunities for you to innovate	CI-02–CI-04
3	Generate ideas that are novel to yourself or others	CI-05–CI-07
4	Develop your ideas	CI-08–CI-10
5	Apply your ideas	CI-11–CI-15
6	Facilitate a creative and innovative environment for yourself and others	CI-06, CI-12, CI-16–CI-18

Twenty-seven instructional strategy groups

Each practitioner skill chapter explicitly teaches all three groups, then addresses assessment, complexity, support and next practice. The source resource pages remain linked as leads; their presence is not presented as an independent review.

Skill	Source strategy group	Source pages	Reworked destination
Reading	Authentic Documents	47, 48	Teaching chapter
Reading	Foundational Reading Skills	48, 49	Teaching chapter
Reading	Systematic Reading Strategies	49, 50	Teaching chapter
Writing	Integrated Grammar	56	Teaching chapter
Writing	Context-Driven	57	Teaching chapter
Writing	Writing Process	58	Teaching chapter
Numeracy	Learner Attitudes and Emotions Relating to Numeracy	64, 65	Teaching chapter
Numeracy	Contextualized Numeracy Instruction	65, 66	Teaching chapter
Numeracy	Collaborative Learning	66, 67	Teaching chapter
Digital	Needs Assessment	72, 73	Teaching chapter
Digital	Addressing Confidence	73	Teaching chapter
Digital	Problem-Based Approach	74	Teaching chapter
Problem Solving	Problem-Based Learning	79, 80	Teaching chapter
Problem Solving	Use Problem-Solving Models	80	Teaching chapter
Problem Solving	Group Learning	81	Teaching chapter
Communication	Intercultural Competence	86, 87	Teaching chapter
Communication	Active Listening	87, 88	Teaching chapter
Communication	Role-play and Simulations	88, 89	Teaching chapter
Collaboration	Building Relationships	93, 94	Teaching chapter
Collaboration	Explicit Instruction (Direct Instruction)	94	Teaching chapter
Collaboration	Structured Guidance and Roles	95	Teaching chapter
Adaptability	Build a Growth Mindset	100, 101	Teaching chapter
Adaptability	Focus and Emotional Regulation	101, 102	Teaching chapter
Adaptability	Adaptability Training for Leaders and Work Contexts		

102 | Teaching chapter | | Creativity & Innovation | Real World Applications | 107, 108 | Teaching chapter | | Creativity & Innovation | The Creative Problem-Solving (CPS) Model | 109 | Teaching chapter | | Creativity & Innovation | Engage Underrepresented Groups | 110 | Teaching chapter |

Twenty-seven grab-and-go activity patterns

The original activity purpose is preserved, while examples, wording, access arrangements and evidence collection are reworked. The new activities are not represented as verbatim SkillPlan exercises.

Skill and source page	Source activity pattern	ACCESS application
Reading, 53	Compare document structure/features/purpose in groups	RD-02 and RD-09: compare features and purposes
Reading, 53	Use a manual/SOP to answer task-based questions with a reasoning account	RD-13, RD-14 and RD-17: task questions and an explained reading route; low-risk borrowing instructions replace a technical SOP
Reading, 53	Compare documented options and justify a decision	RD-06 and RD-18: compare documented choices and justify a decision
Writing, 61	Analyze/model workplace emails and adapt tone	WR-04 and WR-13: model, draft and revise a message for tone and purpose
Writing, 61	Summarize an incident in a form using key facts	WR-07–WR-09: synthetic factual materials record using event details
Writing, 61	Write a procedural document then explain it	WR-10: original low-risk classroom procedure with a reader check and oral explanation
Numeracy, 70	Measure varied items with an imperial tape	NU-11/NU-14 plus the practitioner ruler/tape task and integrated Lesson 1: scale, units and fractions
Numeracy, 70	Calculate volume/weight of contextualized shapes	Practitioner chapter: fully worked fictional box volume and supplied mass-per-volume relationship, check and half-depth extension
Numeracy, 70	Calculate group shares and make a bar or pie chart	NU-12 and NU-15: percentages, chart construction and limits on interpretation
Digital, 77	Compare digital devices/platforms and select a suitable tool	DG-04: compare tools against a purpose
Digital, 77	Evaluate online information against explicit criteria	DG-07–DG-12: source evaluation, navigation and online search
Digital, 77	Examine password/security practices using fictional examples	DG-13–DG-15: practice safety and account-protection decisions; copied numeracy tips from source p. 77 are replaced
Problem Solving, 84	Apply a structured problem-solving cycle to a workplace problem	Cases A–C and PS-01–PS-18: complete problem-solving cycle

Skill and source page	Source activity pattern	ACCESS application
Problem Solving, 84	Ask questions to understand a conflict and compare responses	PS-05, PS-09 and PS-12: clarify, question assumptions and respond to a challenge
Problem Solving, 84	Quantify a problem and identify affected stakeholders	PS-03, PS-11 and PS-16–PS-17: affected people, constraints, measurable results and limitations
Communication, 91	Use Describe-Analyze-Evaluate to investigate a miscommunication	CM-14: Describe–Analyze–Evaluate with observations and alternative interpretations
Communication, 91	Identify effective listening and practise it	CM-01–CM-06: discuss and practise listening actions without posture/eye-contact grading
Communication, 91	Give instructions and paraphrase/check understanding	CM-04 and CM-08: receive instructions, paraphrase and check understanding
Collaboration, 98	Complete a low-stakes team task and reflect on contributions	Visitor-pack task and CL-15–CL-16: low-risk team activity, reflection and retry
Collaboration, 98	Analyze workplace/social rules and responsibilities	CL-02 and CL-17: observable agreements and context-specific expectations
Collaboration, 98	Analyze and practise a difficult interaction	CL-07–CL-09: distinguish and practise responses to difficult interactions
Adaptability, 105	Set SMART goals and revisit learning plans/journals	AD-02, AD-17 and the evidence record: specific goals, timeframes and reflection
Adaptability, 105	Practise optional strategies to refocus under stress	AD-05: learner-selected task-focused pause or clarification, without compulsory personal disclosure
Adaptability, 105	Adapt training plans to differing learner needs	Individual supports throughout and practitioner teaching choices: adapt instruction to observed needs rather than group stereotypes
Creativity & Innovation, 113	Brainstorm and develop ideas in varied formats	CI-05 and CI-16: generate ideas through varied modes and facilitate
Creativity & Innovation, 113	Use a creative problem-solving model on an open problem	Shelf case and CI-01–CI-15: complete creative process, prototype, test and revise
Creativity & Innovation, 113	Build a permission-based portfolio of tested improvements	CI-18: permission-based development portfolio and reflection

Assessment, complexity and resource-page coverage

Skill	Assessment pages	Source resource page(s)	Treatment
Reading	50, 51	52	Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads.
Writing	59	60	Teaching chapter explains task evidence, supports, confounds, complexity and retry; source

index preserves leads. | | Numeracy | 67, 68 | 69 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Digital | 75 | 76 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Problem Solving | 82 | 83 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Communication | 89, 90 | 90 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Collaboration | 96 | 97 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Adaptability | 103 | 104 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. | | Creativity & Innovation | 111 | 112 | Teaching chapter explains task evidence, supports, confounds, complexity and retry; source index preserves leads. |

The source describes developmental/preliminary proficiency alignment. The current federal learning-steps page, checked by the project on 23 October 2026, also says the program will refine proficiency levels over time. The four classroom feedback descriptions are local evidence language, not official level assignments.

Three appendix lessons and all six source handouts

Integrated lesson plans contains complete original teaching sequences, cases, printable tables and answer guidance. All three source lessons specify 90 minutes; the new lessons also supply explicit proposed 90-minute sequences. The source virtual-delivery ideas are addressed with accessible paper/digital routes and honest limits on what an off-device task demonstrates.

Source handout	Pages	Original ACCESS replacement and expansion
Handout 1: Measuring in Imperial	120–121	Lesson 1: M1 individual measurement record and M2 fixed paper practice, plus scale-reading examples and item-dependent observation.
Handout 1: Fishbone Diagram Template	126	Lesson 2: P3 cause map, supported by P1 counts and P2 evidence cards.
Handout 2: Five Whys Template	127	Lesson 2: P4 supported why chain, with P5 trial/evaluation; no requirement to stop at exactly five questions or claim one proven cause.
Handout 1: Parts of an Email	132	Lesson 3: E1 message parts and their jobs; the original teaching passage supplies the instruction that the source referenced as an unavailable slide deck.
Handout 2: Sample Email	133	Lesson 3: complete case brief, unclear draft and useful revision; E3 plan and reader check.
Handout 3: Formal and Informal Language / Practice	134–135	Lesson 3: E2 six practice prompts, answer guidance and E3 reader check; respectful register choices replace absolute language prohibitions.

Historical professional-development directory

Practitioner development explains how to choose learning, develop a growth plan, coach, moderate evidence and pilot a lesson. These six listings preserve the supplied guide's directory. Listing a provider here does not confirm current registration, eligibility, price, credential recognition or course delivery. Independently retrieved current sources are identified separately in that chapter.

Listing as supplied	Source page	Index status
Alberta Workforce Essential Skills: Practitioner Training	136	Historical source lead; verify current offering directly.
Bow Valley College: The Test of Workplace Essential Skills (TOWES)	136	Historical source lead; verify current offering directly.
Douglas College: Aboriginal Essential Skills Journey — Planting the Seeds for Growth	137	Historical source lead; verify current offering directly.
Douglas College: Essential Skills Practitioner Training Certificate	137	Historical source lead; verify current offering directly.
SkillPlan: Customized Practitioner Workshops	137	Historical source lead; verify current offering directly.
Workplace Education Manitoba: Skills for Success Workplace Practitioner Certificate	138	Historical source lead; verify current offering directly.

Original bibliography and resource directories

The original-guide bibliography index preserves all 122 parsed citations from pp. 139–148 and the source's own cross-reference notes. The inventory preserves all source page text and URI annotations, including the key-resource pages 20–22; authentic-document collection routes on p. 28; occupation, sector and inclusion directories on pp. 29–31; overarching-approach resource lists; nine skill resource pages; and professional-development pages 136–138.

These directories cover transferable occupational information, construction, manufacturing, tourism, Indigenous learners, 2SLGBTQI+ learners, neurodiversity, disability, newcomers and anti-racism. The teaching chapters apply individual choice, accessibility, contextual relevance and permission. They do not infer a preferred learning method from membership in any group. External materials remain source leads unless an explicitly attributed current research entry describes what was actually read.

The bibliography index preserves source metadata rather than silently repairing it. Known source issues include the Archer/Barclays cross-reference placement on p. 140, an incorrect TOWES page pointer, a mislabeled OECD cross-reference and a Kivunja year inconsistency between body and bibliography. Consult the linked original page when resolving a citation.

Deliberate corrections and limits

- Historical national statistics and economic projections are identified as historical; they are not republished as current findings or deficit claims about Indigenous learners.
- Document Use is integrated across the nine skills. Continuous learning is transversal; historical and current frameworks are not forced into a one-to-one replacement chart.

- The Numeracy component-six heading error on p. 63 and connection-label issue on p. 70 are corrected using the source component list. Digital p. 77's copied numeracy teaching tips are replaced by relevant digital-safety instruction.
- Eye contact, stillness, accent and emotional display are not universal assessment criteria. Teaching observes understanding, contribution, selected strategies and supported performance.
- Punitive or deficit-framed examples are replaced with original, bounded classroom cases. Cultural knowledge and creative work are not treated as freely reusable resources.
- Measurement uses suitable safe objects and supplied fixed values; body measurements, traffic-area tasks and tape-extension contests are not carried forward. Illustrations are not treated as physical measuring instruments.
- Cause maps and why questions identify hypotheses and possible system conditions; they do not prove a single cause. Creativity tests and small improvement trials support limited conclusions.
- Writing evidence can use local drafts; no external message, account creation or disclosure is required. The email lesson supplies its own original instruction and model.
- All proposed teaching durations, fictional facts and local feedback descriptions are distinguished from program requirements, current technical standards and official proficiency ratings.

The inventory's source-issues array retains the page-specific rationale. Current online research supports selected updates; it does not transform the whole original bibliography into a verified evidence base. Local review, learner feedback and any required community permissions remain specific to the eventual delivery context.

Original guide bibliography: source index only

This is a complete index of the **122 parsed bibliography entries** in the user-supplied SkillPlan *Skills for Success Get Started Guide for Practitioners*, revised March 2024, pp. 139–148. It preserves extracted citation metadata and the guide's printed cross-references. These are sources listed by SkillPlan, **not 122 publications independently retrieved or verified for the ACCESS books**.

The original bibliography is the authority for layout and wording. Wrapped URLs, typographic artefacts and misplaced cross-reference notes can occur in extraction and in the supplied source. They are not silently corrected here. The machine-readable inventory retains the complete text of each source page and extracted external URI annotations for inspection.

This index preserves research leads. Before relying on an outside work, retrieve the relevant edition, read the needed passage, check its population and context, and record what was actually accessible. Current, independently checked sources are identified separately in the practitioner chapters and project research.

Known metadata cautions include the p. 140 Archer/Barclays cross-reference placement, the TOWES page pointer, an OECD topic label, and the Kivunja publication-year inconsistency. The source-page links below allow those issues to be resolved against the supplied PDF.
